With the announcement by the Illinois Committee on Public Utility Information of the appointment of Keith Spade to head the Public Service Speakers' Bureau comes the information that this bureau will enter into a larger public speaking program. In the past year the work of this bureau has been to co-ordinate all the companies and their employees behind the speaker when he appeared in a community, to obtain proper newspaper and other publicity on speeches so that the message might go to others than the audience, and to assist managers in developing speaking talent within their own organization.

Mr. Spade comes to the bureau from the Monmouth Chamber of Commerce. He will further the activities of this department so that during the coming year greater benefit will be derived from the efforts of the speakers than has been in the past. In order to start this "greater speaking effort," a conference of managers in territorial districts will be held at conveniently located cities to acquaint local and district managers with the details of the program and to perfect district organizations. Each district committee will be responsible for formation in each city or town of a local public service speakers' bureau or unit and each local unit will take care of local engagements of lesser importance.

Two-and-a-Half-Cent Increase to Michigan Employees

The board of arbitration chosen to settle the wage controversy between the employees of the Michigan Railway lines, Jackson, Mich., and its officials, recently granted a 2½-cent increase an hour, effective June 1, 1923. The award was signed by Richard Price, the company's arbitrator, and John H. Lourim, the third arbitrator. Samuel H. Rhoades, representing the employees, refused to sign the award.

The men demanded an increase of approximately 15 cents an hour on April 30 to take effect as of June 1. At that time they proposed a wage scale of 60 cents an hour for motormen and conductors on two-man city cars, 65 cents an hour for operators of one-man city cars and 70 cents an hour for interurban motormen and conductors. The men had also asked for time and a half for overtime, fifteen minutes additional time for turning in day's receipts and thirty minutes additional time for making out accident reports.

The board said that in view of the company's financial condition the rates for conductors and motormen would be as follows: On city divisions the first year of service on two-man cars 44½ cents an hour; one-man cars 49½ cents; thereafter on two-man cars, 47½ cents, and on one-man cars 52½ cents.

On interurban divisions for the first six months' service 49½ cents and thereafter 54½ cents. In addition to the above there should be 5 cents an hour paid for all work in excess of regular schedule runs.

Samuel H. Rhoads, employees' arbitrator, who refused to sign the award, said that he did not think that the maximum rate of 54½ cents was a reasonable wage for the men, contending that with the present cost of living the wage was not sufficient for a position that was so exacting and which entailed great responsibility. Discussing the contention that the company was unable to pay more he said that the remedy should not be to make the employees work for an unreasonably low wage. He said that the public, which was given the benefit of the service, should pay what it costs to operate the railway system, including the payment of reasonable wages and a fair return to the owners.

Candidate Under Indictment Defeated in Buffalo—Socialist Re-elected

State Senator Robert C. Lacey of Buffalo, who is under indictment in connection with the dynamiting of the Buffalo-Niagara Falls high-speed line of the International Railway during the strike a year ago, when about two-score passengers were injured, was defeated for member of the City Council at the last municipal election. He polled a larger vote, however, than the two members of the Citizens' ticket fostered by the Chamber of Commerce and other business interests of the city. Frank C. Perkins, Socialist, and

an advocate of municipal ownership, who has been bitter in his attacks on the International Railway, was re-elected by the largest vote ever received by a candidate for public office in the city. He polled almost three times the number of votes cast for the Citizens' ticket candidate for better government.

Official Must Serve Sixty Days for Criticising Court

The United States Supreme Court held, in effect, in a decision rendered on Nov. 19, that Charles L. Craig, Comptroller of the City of New York, must serve a sentence of sixty days in jail for contempt of the United States District Court. The case arose out of receivership proceedings for the New York Railways in 1919. Receivers were named by the District Court. The city of New York applied for appointment of a co-receiver to represent it for the Brooklyn Rapid Transit Company. This the court refused. Comptroller Craig wrote Public Service Commissioner Louis Nixon a letter criticizing the court. The letter was published. Some months later contempt proceedings were brought and Mr. Craig was adjudged in contempt. The case reached the Supreme Court on a question of the competency of the court to hold Mr. Craig and not on the main issue of contempt.

Trackwork Recommended in Madison in Connection with Paving

The city engineer of Madison, Wis., has recommended that the City Council should take the proper steps to adopt an ordinance requiring extensions and improvements to be made by the Madison Railways to its system simultaneously with the city's street improvement work so that rails will be placed when the city starts carrying out its paving program.

A big track extension problem faces the railway if the city carries out the improvement of streets in which there are car tracks, as it will require the company to lay a west track on Brees Terrace, double tracks on University Avenue, North Hamilton Street from Pinckney to Johnson, and Williamson from Baldwin to the Yahara River. Heavier rails will also be laid by the company on Jenifer Street from Williamson Street to Baldwin Street, a distance of six blocks, if a resolution introduced before the Council for that purpose goes through.

An ordinance passed by the Council last summer provided that the company would hereafter be relieved of all future charges for paving between its track zones.

Must Not Abandon Line.—The State Supreme Court at Topeka, Kan., recently decided in favor of the city of Salina in a case brought to compel the Salina Street Railway to continue operation of a part of its line which the company had thought to abandon.

Service Retained in Davenport

Agreement Between City Council and Tri-City Railway Allows for a Ten-Cent Cash Fare with Low Ticket Rate

Street car transportation has been retained in Davenport, temporarily at least, by the following major provisions of an agreement reached between the City Council and the Tri-City Railway of Iowa: A 10-cent cash fare, but fares as low as 6½ cents on a ticket plan, rerouting to eliminate approximately 4½ miles of trackage no longer needed, a faster service during the rush hours of the day, payment by the company of its assessed share of the 1923 paving program, valuation of traction lines on same basis as other business concerns for general taxation, single instead of double truck cars, trial period of four months for the new ticket plan, allowance of a 6 per cent return on the investment; city to favor enactment by the Iowa Legislature of provisions making it optional with cities to relieve electric railways of paving cost.

This settlement plan is not only accepted by the City Council and traction line but is also indorsed by a citizens' committee selected from non-political and representative civic organizations. The report, accepted by the committee of the whole of the Council on Nov. 20, will be ratified on Nov. 28 at the regular Council session.

It is in response to a clear statement by President B. J. Denman of the traction lines of the possibility of discontinuing railway service that the present plan came into existence. The surface lines have lost money for several years past and their straits finally became so acute that the city was told service would be abandoned unless a relief plan could be devised. Negotiations of several months have finally resulted in the acceptance of the present plan.

By the sale of fifteen tickets for \$1, seven for 50 cents and three for 25 cents, it is hoped that riding can be popularized to such an extent that it will be encouraged and revenues increased. The company is hoping that this will be the case, but acceded to the city's request along this line with considerable doubt as to the possibility of thereby increasing the revenues. The fare up to the present time has been a straight 8-cent fare.

Also by this arrangement the company agrees to pay \$120,000 for paving which it believes should not be assessed against a traction line. Such an investment will never bring in a cent of revenue and is also accepted by the company without enthusiasm and largely because of the fact that the company considered itself obligated to this payment.

The valuation on which the company is to be allowed a return of 6 per cent is \$3,250,721, another concession by the traction lines, as the latter proposed a

valuation of \$4,250,000. The new system of fares is to go in operation on Jan. 1, 1924, and the system is to continue for a period of four months after the entire plan is put into operation.

It is provided that, in case the revenues in succeeding months do not return 6 per cent on the investment, first the fifteen tickets for \$1 rate and later the seven tickets for 50 cents rate be abandoned and the three tickets for 25 cents rate be retained as the basic fare.

News Notes

Franchise Granted.—The Lake Shore Electric Railway, Cleveland, was granted a twenty-five-year franchise by the Sandusky County Commissioners on Nov. 13. Besides rights to operate cars through the county, the company can use the new concrete bridge to be built across Sandusky River at State Street, Fremont. Work on the new bridge will start at once. In return, the company must pay to the county \$12,500 cash within sixty days and make an annual payment of \$1,000 during the life of the franchise, or as long as it uses the bridge jointly with the county. The company must also move part of its track from McPherson highway, west of Fremont, to eliminate danger to traffic.

Inter-Utility Meeting Held.—For the first time in the history of Wisconsin utility circles an inter-utility meeting took place recently in Janesville. Approximately 130 executives and employees attended. Recommendations were unanimously passed to assemble informally at frequent intervals, affording individuals an opportunity to interchange ideas with one another.

Getting at Bottom of Dynamite Outrage.—New developments in the government's investigation of the dynamiting of the Buffalo-Niagara Falls high-speed car in August, 1921, during the strike of platform employees which resulted in the injury of almost forty passengers, are expected to implicate several more of the company's striking employees, it was stated at the office of Colonel William J. Donovan, United States District Attorney. The renewal of the investigation was prompted by alleged confessions by men believed to be involved in the dynamiting outrage. The fourteen men now under indictment will be placed on trial early next month in United States court.

Transit Work Hastened.—Following Director Twining's recent appearance before the City Council of Philadelphia, announcing that he would proceed with preliminary work on transit construction if he were given the necessary funds, it was immediately proposed that the money be provided. The preliminary work in connection with the Broad Street subway of the Darby line will be financed by an appropriation of \$50,000, which the City Council will give the

Department of Transit through a transfer bill. Director Twining said that the money would be expended in making borings, particularly in the Schuylkill, where it will be necessary to erect piers for the Darby line. Some part of it will be used for borings in North Broad Street.

High-Speed Line When Costs Come Down.—The Ohio River Edison Company, Youngstown, Ohio, a subsidiary of the Pennsylvania-Ohio Electric, in turn controlled by the Republic Railway & Light Company, is securing a right-of-way from the Ohio River Valley to this district for an electrically operated freight line to be built when conditions permit. The right-of-way for the contemplated freight line parallels that of a high-tension electric power line that the Ohio River Edison Company will build next year from its steam-electric plant at Toronto on the Ohio River to Youngstown.

Resolution Calls for Car Approval.—A resolution has been introduced before the City Commission of Trenton, N. J., calling for the approval of all trolley cars by that body before they can be placed in operation. The ordinance does not prescribe a type of car to be used by the Trenton & Mercer County Traction Corporation, but does provide that the type be of a character to meet the approval of the commission. The ordinance is understood to have been introduced on account of dissatisfaction with the conditions surrounding the one-man cars now being used in Trenton. The commission is said to be anxious to have the railway use larger one-man cars. The ordinance gives the commissioner the power to reject all cars not approved by that body.

Opposes Company's Relief Petition.—Protest against a petition filed with the Seattle City Council by the Seattle & Rainier Valley Railway, asking relief from certain franchise agreements, was voiced recently at a mass meeting of residents of the Rainier Valley district. The petition presented asks among other things that the road be released from the payment of a 3 per cent tax on its gross earnings, and from paving 1,000 ft. of the street between its tracks. W. M. Brown, manager of the company, appeared before the meeting and outlined the company's position in asking the relief, and stated that unless it is granted, the company will have to restore fares to the 10-cent level next month. The present cash fare is 10 cents. Three tokens are sold for a quarter.

Paving Plan Halted.—Denver figured a paving program, known as "the \$4,000,000 paving job," but on the eve of starting, the city engineer's office finds that the Denver Tramway, which is supposed to stand its proportion of the amount, cannot pay for more—in any one year—than "between and for alongside of its tracks, a 6-mile length." City officials, the tramway officials and others are trying to work out a plan that will permit the city to proceed with the program.

Foreign News

May Electrify Rumanian Railways

A recent report from Bucharest stated that the Rumanian government intends electrifying portions of the railways of the country. Some facts with respect to this property are noted in view of this report.

In September, 1923, the railway traffic on Rumanian territory amounted to more than 50,000 trains per month, or an average of 1,600 trains per day, as against only 287 trains per day in 1921. Of the total number 57 per cent are passenger trains and 43 per cent freight trains. The traffic is carried on by means of 2,000 locomotives, as compared with 1,540 in June, 1922, and 1,050 in June, 1921.

Most of the bridges have been reconstructed and rails and sleepers renewed. Large orders have been placed in Germany of late for all kinds of rolling stock and material. The railway lines in Bessarabia—formerly Russian territory—have undergone great improvements and the gage has been changed from the Russian to the standard Rumanian. However, the substructure of these lines leaves still much to be desired. The receipts of the Rumanian Railways rose from 64,000,000 lei in September, 1921, to 200,000,000 in 1922, and amounted in August, 1923, to 305,000,000 lei.

American manufacturers of electric railroad equipment would do well to pay close attention to the further developments of the Rumanian Railways. All the roads are owned and operated by the state (Caile Ferate Romane), with head offices at Bucharest.

Berlin's Record Under Private Company

The transfer of the Berlin Municipal Street Railways from direct municipal operation to operation by a private corporation seems to be working well, according to an article by Dr. Lademann in the Oct. 26 issue of *Verkehrstechnik*. It will be recalled, as the *ELECTRIC RAILWAY JOURNAL* for Sept. 15, page 423, pointed out, that the lines are still publicly owned.

The reorganization became effective on Sept. 10, 1923, and was accompanied by a large reduction in personnel and also a more practical interpretation of the municipality's eight-hour day rule for all employees. In the case of the street railways, this rule now means eight hours' platform time. The system has also been rerouted to great advantage and eighty-nine routes have been cut to thirty routes which are far more direct. The new lines are better balanced as regards traffic and there has been a reduction of car-miles by more turn-backs.

The lines now have a single fare

without charge for transfer. This fare was 200,000,000 marks up to Nov. 1, but on that day it was to be increased tenfold. The same increase to the same fare was to be made on the subway and on the bus lines.

The earnings for the first five weeks of operation under the company plant, i.e., since Sept. 1, have proved encouraging. The deficit of 20,000 gold marks (100,000,000,000 paper marks) a day has been eliminated. The number of car-kilometers run has been reduced from the August average of 200,000 (124,000 car-miles) to 120,000 (74,400 car-miles) a day. The density of traffic has increased from 3.31 per car-km. (5.1 passengers per car-mile) to between 4 and 5 per car-km. (6.4 to 8 passengers per car-mile). It must be remembered in connection with the density figures that the average Berlin street car has less capacity than a Birney safety car.

Electric Cars Replace Mules in Maranhao

Mule-drawn cars operated by the State of Maranhao, Brazil, are to be replaced with modern electric cars. Maranhao, the sixth largest state with a population of more than 500,000, occupies a wide sweep of the north coast of Brazil.

Electrification Plans in Czechoslovakia

A comprehensive program of electrification of the steam railroads of Czechoslovakia is just beginning. The first line to be electrified will be the Prague-Kladno line, which is a single-track coal-carrying railroad 30 km. in length. After this will follow the Prague-Zdice-Plzen and Prague-Kolin-Pardubice lines, respectively 115 and 104 km. of double track.

Electrification work will be furthered by the construction of several electric central stations, the first of which, at Rvenice, in the north Bohemian lignite coal district of Chomutov, Most and Duchcov, is nearing completion and will have 40,000 kw. in service next year. A 100-kv. transmission line between Rvenice and Prague, over 84 km. long, is being erected. Following this a hydraulic plant will be built at Stechovice on the Vltava River, with a capacity of some 30,000 kw. Both these plants are being constructed by the Central Electric Plants Company, partly with public and partly with private funds.

The system of electric traction to be used has not yet been definitely decided. The neighboring lines of Germany and Austria employ single-phase current with 15 to 16½ cycles and 15 to 16 kv. on the trolley wire, but the high-tension direct-current system also has many

adherents, as in France, Belgium, Holland and Great Britain.

The railroads are of light construction, with normal weights per axle of 14.5 metric tons and 1,435 mm. gage, thus giving only limited possibilities as to weight and dimensions of the traction machinery.

London Tube Facilities to Be Extended to Meet Competition

More than £13,000,000 will be expended on extensions of London's tube railways during 1924 and 1925. It has been demonstrated to the satisfaction of the London company's management that a short underground railway no longer can be operated profitably. For this reason plans have been perfected for joining existing lines and for the driving of new tubes, so as to make possible longer hauls. Provision will be made for the operation of more express trains and the maintenance of much higher speeds. This will require some substitution of rail and extensive roadbed betterments.

The announcement has been made that during this month construction will be started. These new works were authorized by an act of Parliament passed last summer, and the beginning of operations has been expedited in order to help in the coming winter the relief of unemployment. It is stated that this new work, along with other projects, will give employment to 25,000 or 30,000 men for nearly two years.

The principal extensions will be the driving of the London Electric Railway's Hampstead tube from Golders Green to Eggewear and the carrying of the tube of the City & South London Railway from Clapham Common to Morden. This latter extension also involves heavy reconstruction in increasing the bore of the existing tube from 10 x 7 ft. to 11 x 8 ft. A new cut-off will be put through which will give the South London line through service from two great traffic centers—Charing Cross and Waterloo Station.

The Piccadilly tube of the London Electric Railway is to be extended from Hammersmith so as to connect with the District Railway near the junction of its branches to Richmond and to Uxbridge. This will make possible the operation of through tube trains from those important suburbs. The Piccadilly line runs under the very heart of the business district, but its income comes largely from short-haul traffic.

These major improvements have been hastened by the loss of buses of short-haul business. Underground lines in 1923 have been running some 500,000 passengers weekly behind the 1922 figures. The decrease is due almost entirely to the use of buses for the shorter trips it is believed. Since some 60,000,000 passengers are carried weekly on the underground railways, the loss is less than 1 per cent as compared with 1922, but the management believes these losses will continue at an increasing rate and steps are being taken to meet them.

Financial and Corporate

Interurban Control Changed

**Bondholders Now Operate Iowa Road—
New Interests Hope to Make
Line Profitable**

Control of the Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa, has passed into the hands of the holders of the first mortgage bonds of the company through their protective committee. E. B. Kane, chairman of that committee, has explained that on Oct. 27 it secured control of 21,700 shares of the total outstanding of 23,330½ shares of the common stock. The stock has been transferred to him as trustee for the bondholders' protective committee for the purpose of enabling the committee to take over the company and all its property and assets and operate them without immediate recourse to the remedies provided in the deed of trust under which the first mortgage bonds are secured.

Immediately following the transfer of stock, the old management resigned and was succeeded by the following new directors representing the bondholders' protective committee: C. M. Cheney and J. B. Knowles, Waterloo, Iowa; George E. Hise, Des Moines, Iowa, and Charles J. Hetburn and Edward B. Kane, Philadelphia. The officers who resigned were L. S. Cass, president; J. F. Cass, vice-president; C. D. Cass, general manager, and W. H. Burk, secretary, treasurer and auditor. Officers were elected as follows to fill these vacancies: C. M. Cheney, president and general manager; C. D. Cass, vice-president, and J. B. Knowles, secretary, treasurer and auditor.

Mr. Kane explains that the immediate effect of the change of management was a reduction of expenses. It is believed that other economies are practicable without affecting the efficiency of the service. The developments just noted clear the way for constructive efforts. Radical changes, he says, must not be expected at once. Reasonable time should be allowed the new management for the application of new policies, the introduction of economies and the development of new business. Not until these influences have been fully tested, will the committee be able fairly to gage the earning possibilities of the property under the reorganization.

Mr. Kane says that the strategic position of the road with its valuable freight belt line and its connection with five steam trunk railroads suggest the practicability of a merger under the new railroad act. This, too, he says will require time for consideration and negotiation. He explains that the company is at present earning little more than its operating expenses, taxes and maintenance. Liberal allowance has, how-

ever, been made for upkeep so that the property is in fair physical condition. What with economies, increased traffic and reduced bus competition, the new management hopes to present in the coming year results which will reflect a favorable contrast with the past.

Up to the present time, 85 per cent of the outstanding bonds have been deposited with the protective committee. In view of the developments just noted, the committee has decided that the time for the deposit of additional bonds under the bondholders' protective agreement shall be extended to Dec. 31.

Deficit in Cincinnati in October

Compared with October, 1922, when a 7½-cent fare was in effect, the report of the Cincinnati Traction Company for October, 1923, shows that while the income of the company was slightly in excess of the corresponding period last year, there were fewer cash fares paid. In October, 1923, when the 8-cent fare was started the traction company carried 9,263,041 pay passengers and the revenue obtained was \$730,643. During the same period in 1923 under the 7½-cent rate the number of car riders was 9,282,803 and the revenue produced was \$705,295.

Other revenues received by the traction company during October, 1923, bring the total receipts to \$737,391. The traction company paid for operating expenses during October \$499,533, and the remainder was used to pay off other obligations due under the service-at-cost franchise, with the exception of \$29,989 due the city for that period as a franchise tax.

The traction company during October incurred a deficit of \$73,350. In the event the company shows a deficit in its operating expenses for November it will be compelled to raise the rate of fare another half cent to 8½ cents on Jan. 1. Under the terms of the service-at-cost franchise the traction company is permitted to raise its rate of fare following deficits in its operating expenses for two consecutive months.

J. K. Newman Reported in Kansas City Reorganization

It is expected that J. K. Newman of Newman, Saunders & Company, New York and New Orleans, will head the movement to reorganize the Kansas City Railway. Mr. Newman is said to be at the head of a syndicate which has purchased through the Chase National Bank, New York, \$5,000,000 of defaulted notes and bonds of the Kansas City Railways. The consideration is not known, but the company's first mortgage bonds have been quoted at 40 cents on the dollar, and second mortgage paper much lower.

Mr. Newman has been conferring with other security holders in the company in Chicago, Philadelphia and other northern cities.

Resolution Authorizes Bond Issue by Philadelphia Rapid Transit

A resolution was introduced in the City Council of Philadelphia recently by Mr. Weglein which authorized the Philadelphia Rapid Transit Company to float a \$2,500,000 first-mortgage bond issue. The \$2,500,000 bond issue, made possible under the transit agreement of 1907, will be secured by mortgages on the Luzerne Street and Callowhill Street carhouses, and upon the terminal to be built at Twentieth and Johnston Streets. At present there is an existing mortgage on the Luzerne and Callowhill Streets terminals for \$1,300,000, of which \$335,000 has been paid off. The proceeds of the \$2,500,000 issue will be used to pay off the \$965,000 outstanding and to complete the construction of the South Philadelphia terminal.

A second ordinance, which was also presented by Mr. Weglein, would permit the company to buy up \$8,874,000 of a \$10,000,000 bond issue floated in 1912. The bonds were sold with the understanding that they could be recalled at any time up to Dec. 31, 1923, and resold at a higher figure. According to a letter to Mr. Weglein from W. C. Dunbar, president of the Philadelphia Rapid Transit Company, the issue is recalled because the company wants to avoid a permanent sale of the bonds at the low figure.

Another Melon at Montreal

The *Canadian Financial Post* says that there is reason to believe that shareholders of the Montreal Tramways will shortly have the opportunity of subscribing for about \$1,000,000 of stock of their corporation. The stock is now selling at \$150 a share. The amount of capital stock outstanding is only \$4,000,000, and a \$1,000,000 issue would give each shareholder the opportunity of buying one share of stock at \$100 for each four shares now held. This would make the "rights" of subscription worth about \$12.50 for each share at present outstanding.

There was \$2,000,000 of Montreal Tramways stock issued at the time of organization. In April, 1913, stockholders were offered \$1,000,000 at par, and as the stock went to about 235 in the next year the privilege of buying the stock at par was valuable. In September, 1915, another \$1,000,000 was allotted at par, although the stock was selling in the neighborhood of 220.

Negotiations for the sale by the Montreal Tramways of an important right-of-way owned by it in the city of Montreal to the Canadian National Railways has attracted attention. The right-of-way parallels the C. N. R. line, which requires additional land to bring its right-of-way up to the minimum requirements of the Board of Railway

Commissioners. The sale, which is understood to have been consummated, would add a comfortable sum to the company's cash position.

Washington-Virginia Securities in Default

The Washington-Virginia Railway, Washington, D. C., has defaulted in the payment of principal and interest of its 6 per cent bond secured gold notes, dated Jan. 1, 1920, maturing Jan. 1, 1922. In consequence it has been announced that the Bank of North America & Trust Company, Philadelphia, trustee, will sell on Nov. 28, at public auction, \$3,000,000 first lien refunding mortgage gold bonds of the company, dated Jan. 1, 1919, due Jan. 1, 1929.

The company operates 63 miles of line from Washington, D. C., to Alexandria, Mount Vernon, Arlington, Fort Meyer, Rosslyn, Clarendon, Vienna and Fairfax.

Auction Sales in New York.—At the public auction rooms of A. H. Muller & Sons, there were sold this week 400 shares of Interborough Consolidated Corporation, common \$6 lot, and 1,000 shares of Brooklyn Rapid Transit (old stock), \$12 lot. There were sold last week 300 shares of American Cities, 6 per cent preferred stock, \$16 a lot; seventy-five preferred parts of the Kansas City Railway Company beneficial certificates, \$77 lot, and 1,618 shares of the Omaha & Council Bluffs Street Railways Company, common, \$1,600 lot.

High-Speed Electric Line Pays Dividend.—The West Jersey & Seashore Railroad has been put on a semi-annual dividend basis by declaration of 2 per cent paid Oct. 15 to stock of record Oct. 1. Last March the company resumed dividends with a declaration of dividend of 2 per cent out of earnings for 1922. The Pennsylvania Railroad owns 54 per cent of the stock. At a meeting of a committee of stockholders of the West Jersey & Seashore Railroad appointed by the board to consider a lease of property to the Pennsylvania, David Baird resigned as chairman of the committee on account of press of other business and in his stead William

J. Sewell was elected chairman. Mr. Baird remains a member of the committee.

Authorizes Interest Payments.—The receivers of the Pittsburgh Railways were recently authorized by Judge Gibson, in the United States District Court, to pay the Union Trust Company of Pittsburgh, trustee under the Southern Traction Company mortgage, \$100,000, representing interest coupons due Oct. 1, 1923. The receivers were also authorized to pay the Guaranty Trust Company of New York \$63,475 which was the installment due Oct. 1, on the outstanding bonds secured by the general mortgage of the Pittsburgh Railways.

Authorizes Bond Issue.—The Arkansas Railroad Commission has authorized the Fort Smith Light & Traction Company to issue \$107,000 in bonds, the proceeds to be used for extensions and improvements.

Stage Lines Affect Railway's Earnings.—Invasion of the Portland-Williamette Valley district by stage lines has so depleted the earnings of the Oregon Electric Railway, serving this district, that the line was unable to meet its bond interest payments on Nov. 1. Whether the Spokane, Portland & Seattle Railway, which owns the line, will advance the necessary funds in the sixty days allowed before default is problematical, in the opinion of W. F. Turner, president of the Oregon Electric. The net loss from operation, taxes and bond interest during the present year so far amounts to \$204,000, or approximately \$40,000 greater than the corresponding period of last year. It is expected, Mr. Turner stated, that the deficits for the entire year of 1923 will exceed \$300,000. In the event of foreclosure proceedings, a reorganization of the Oregon Electric Railway to bid in the property may be undertaken, it is said.

Preferred Stock for Sale.—Bonbright & Company, New York, are offering at 97½ and accrued dividends to yield about 6.15 per cent, \$2,400,000 of the Electric Bond & Share Company 6 per cent cumulative preferred stock. The preferred stock will be followed by \$22,-

400,000, par value, of common stock, all owned by the General Electric Company.

Bonds Offered.—The National City Company, New York, is offering \$1,000,000 of the Tennessee Electric Power Company ten-year 6½ per cent debenture bonds. The bonds are dated Oct. 1, 1923, and are due Oct. 1, 1933. The proceeds from the sale of these bonds will be used to finance additional property expenditures and to increase the company's working capital. The issue has been authorized by the Railroad & Public Utilities Commission of the State of Tennessee.

Bonds Called.—In connection with the sale of the properties of the Tuscaloosa Railway & Utilities Company to the Alabama Power Company, arrangements have been made for the surrender of the cancellation of more than 90 per cent of the first mortgage, twenty-five year 6 per cent bonds dated July 1, 1940. For the purpose of redeeming and cancelling the bonds, the company has called in all of the bonds at 102 and interest on Jan. 1, 1924.

To Hear City's Appeal.—The Superior Court will hear during the week of Dec. 10 the appeal of the city of Philadelphia from the ruling in which the Public Service Commission fixed the valuation of the Philadelphia Rapid Transit property. This is the result of an order of that court signed by President Judge Orlady. The date had been set for Nov. 19, but under an agreement the hearing was deferred.

State Commission Fixes Buffalo Valuations.—The New York State Tax Commission has submitted to the municipal authorities of Buffalo the valuation figures it puts on the special franchises held by up-state public utility companies for use as the basis for calculating their taxes. The figures as relating to traction lines are as follows: Buffalo & Lackawanna Traction Company, \$200,000; International Railway, \$7,345,000; South Buffalo Railway, \$22,800. The commission will hold a hearing in Buffalo on Nov. 27, at which the corporations will have an opportunity to protest if they feel the valuations are too high.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of

materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on 105 street and interurban railways in the United States, operating more than 100 passenger cars each, and weighted according to number of cars.

Orders Seven per Cent Stock Issue.—The directors of the Public Service Corporation of New Jersey on Nov. 7 directed that an issue of the 7 per cent preferred stock be made totaling \$11,000,000, which is approximately 12½ per cent of all outstanding shares. The stockholders of record Nov. 17 have the option to take such stock at par in proportion to their holdings. For each eight shares of stock held, common or preferred, the stockholders will be entitled to subscribe for one share of 7 per cent preferred stock. The stock may be paid for in full or in installments, one-tenth with the subscription and at least one-tenth on Feb. 1, 1924, and the first day of each month thereafter. The subscribers will be allowed on such payments interest at the rate of 6 per cent per annum to be accounted for at the time such stock is fully paid for.

Company Is Insolvent.—C. A. Fagan, receiver of the Pittsburgh Railways, has filed a report with the United States District Court at Pittsburgh stating that his company is still "manifestly insolvent" and not in a condition to be returned to its owners in a reorganized state. Mr. Fagan is acting independently of his colleagues, U. D. George and S. L. Tone. Mr. Fagan took issue with Special Master Wasson, who predicted that a surplus of \$264,987 would be shown for the end of the first year after the lifting of the receivership. Mr. Fagan believes that a deficit of at least \$1,549,194 would appear.

Preferred Stock Issue Approved.—The Wisconsin Railroad Commission has placed its approval on the proposal of the Eastern Wisconsin Electric Company to issue \$40,000 of preferred stock for the purpose of securing funds with which to pay for additions and extensions.

First Report Since Reorganization Submitted.—Commissioner Paul H. Maloney of the Department of Public Utilities of New Orleans has submitted to the Commission Council the first annual report of the Public Service, Inc., since reorganization. It covers the trial period of one year, during which it was agreed that the company was to earn a return of 7½ per cent on a valuation fixed by the city. The returns of the corporation for the year show that the net profits were only 6.69 per cent. No comment was made by Commissioner Maloney upon the report in submitting it to the Commission Council, other than the announcement that the figures are now being gone over by the Auditing Department of the city, and that the report will soon be available.

Seeks Authority for Issue.—The Oklahoma City-Shawnee Interurban Railway has applied to the Interstate Commerce Commission for authority to operate the 38 miles of main track and other properties acquired at a receivers' sale on Sept. 28, and for authority to issue common stock and first mortgage bonds to the extent of \$800,000 each to be delivered in payment to H. R. Hudson for the title to the railroad. The stock

is to be full paid, non-assessable, of a par value of \$100 per share. The bonds are to be issued for twenty years in denominations of \$1,000, to bear interest at 6 per cent. The application is signed by C. A. Birge, president; Ernest Warley, secretary; and E. W. Shartel, attorney.

Income Increases.—For the first nine months of the current year the Twin City Rapid Transit Company, Minneapolis, reports gross revenues of \$10,210,796, against \$10,251,795 for the first nine months of 1922. Operating expenses were \$7,455,143 for the nine months period last year and this year they were \$7,267,192. The net income increased from \$1,044,509 for the January-September period in 1922 to \$1,151,756 for the same nine months of the present year.

Line Bought.—The Pennsylvania-New Jersey Railroad, a 26-mile branch line from Bristol to Doylestown, Pa., was recently bought by the S. Snyder Corporation, Rochester, N. Y. Salvaging of the line will be begun soon. The purchasers acquired all the track, overhead wires, culverts and stations of the Bristol road, in addition one \$50,000 steel bridge. The Bristol-Doylestown branch was bought by the Pennsylvania-New Jersey Railroad for about \$550,000 in 1912. Automobile competition has been instrumental in the suspension of the railway service.

Preferred Stock Offered.—W. A. Hariman & Company and Dominick & Dominick, New York, are offering at 89½ flat to yield more than 7.8 per cent, \$4,000,000 of the West Penn Company, 7 per cent cumulative preferred stock. The preferred stock is redeemable as a whole or in part on any dividend date on thirty days notice, at 115 and accrued dividends. The West Penn Company owns directly or through subsidiaries substantially all the common stock of the company, constituting the West Penn system. This system is the largest unit in the group of public utilities, controlled by the American Water Works & Electric Company, Inc. The railway comprises 520 miles of track.

Bonds Offered.—W. C. Langley & Company and John Nickerson & Company, New York, are offering at 94½ and accrued interest to yield about 7 per cent \$1,200,000 of the Mississippi Power & Light Company first and refunding mortgage sinking fund gold bonds, known as series A, 6½ per cent. The bonds are dated June 1, 1923, and are due June 1, 1943. The Mississippi Power & Light Company was organized recently to acquire and merge a group of properties which furnish the entire light and power service in Jackson, Vicksburg and several other communities in Mississippi, also railway service in Jackson, Vicksburg, and Greenville. The proceeds from the sale of these bonds and from the sale of preferred stock will be used to pay for additions, extensions and improvements to the properties of the company, to retire certain underlying obligations for other corporate purposes.

Certificates Offered.—Stone & Webster, Inc., will offer \$1,115,000 of Electric Railway Equipment Securities Corporation 6 per cent equipment trust gold certificates, known as the trust of Nov. 1, 1923. These certificates are to be dated Nov. 1, 1923, and will be payable in serial installments Feb. 1, 1924, to Oct. 1, 1928, both inclusive.

Stockholders to Meet.—A meeting of the stockholders of the St. Charles Street Railway has been called for Dec. 12, when that utility, the New Orleans Gas Light Company and the New Orleans & Carrollton Railway, whose stockholders will meet subsequently, will be amalgamated with the New Orleans Public Service, Inc. There are only a few shares of these companies outstanding at the present time, the combination being simply a matter of form, as the merging of the utilities named was provided for when a reorganization of the companies was effected. Carrying out of the plan has been delayed by legal technicalities.

Dividend Declared.—The first dividend to be declared on the second preferred stock of the Portland Railway, Light & Power Company, Portland, Ore., amounted to 1½ per cent. This is payable Dec. 1, to holders of record Nov. 17. The second preferred stock is a 6 per cent non-cumulative issue.

Must Pay Taxes.—Despite protests, the Wisconsin-Minnesota Light & Power Company will be required to pay taxes on property in Chippewa Falls although it is not being used and of no revenue producing value. This decision was handed down by the Wisconsin Tax Commission which sustained the opinion of the city tax assessor, who placed a value of \$95,000 on the property. The company held that this assessment was illegal in that the property was not being used due to the fact that high water in the river in the spring of 1918 damaged the flume which supplied water for power producing purposes from the river to the electric light plant, causing the property to be abandoned shortly thereafter. The city sought to compel the company to pay taxes on the property since 1919, but the commission invalidated this point, allowing the city, however, to place this property on its tax rolls as of 1923 for taxation purposes.

Seeks Bill Dismissal.—The Chicago Railways has opened its case in the Federal courts to dismiss a bill of equity filed by a protective committee of holders of the series 1 participation certificates. These certificates required the company to show cause why \$1,478,400 in cumulated dividends had not been paid. The counsel for the company claimed that there was no money to pay dividends because the earnings had been used for capital expenditure. Attorney for the participation holders asserted that bonds should have been issued to provide for capital expenditures and that the certificate holders had a prior claim on the earnings. Dividends on the series 1 participation certificates have been in arrears since 1917.

Traffic and Transportation

Would Settle Out of Court

Committee of Citizens at Houston Advances Plan for Straightening Out Transportation Tangle

The Houston Electric Company's court case for an injunction to prevent the city from enforcing the present fare ordinance has again been postponed, this time until Nov. 21. This postponement was granted at the request of a committee of citizens who are endeavoring to settle the case out of court.

John A. Beeler, New York, the expert employed by the city, in his report to the city stated that the jitney was the greatest obstacle to an adequate railway system in Houston.

It is Mr. Beeler's opinion that Houston offers a field for both the electric railway and buses, but that both systems should be controlled by one company so that the two systems could be co-ordinated and duplicate service thereby avoided. With this thought in mind, he recommends that the present jitneys be abolished and that the Houston Electric Company be required to establish bus lines wherever they may be needed.

The report recommends several changes in the present operation of the railway system in order to speed up the cars and increase the earnings. The suggestions include several minor changes in present cross-town lines and track layout, the use of one-man cars, double berthing and use of street collectors in the downtown district, a reduction in number of stops per mile (at present cars stop at every corner or about every 250 ft.), and a change in the transfer system so as to reduce the misuse of transfers.

Acting on these recommendations a group of citizens, calling themselves the Citizens' Committee, filed a report with the City Council recommending settlement of fare litigation along the following lines.

Fare case to be suspended pending jitney election. If elimination of jitneys is voted company and city will agree to:

1. Drop fare case.
2. Begin bus operation on Austin Street immediately.
3. Put into effect all of Mr. Beeler's service and operating recommendations within a year.

It is estimated that the immediate improvements will cost \$450,000. The agreement further provides that the Houston Electric Company shall in addition expend \$250,000 during 1924, \$375,000 during 1925 and \$375,000 during 1926 for extensions and bus lines which are detailed in the report.

It is interesting to note that Mr. Beeler states in his report that twelve of the nineteen car lines now in operation are not self-sustaining, while some

of the lines have been losing money for years. His final report supplements the one presented to the City Council. It was addressed to the Citizens' Committee and the public. The report follows substantially in full:

To substitute for Houston's present dual system of transportation, now part railway and part jitney, all railway or all jitney affords opportunity for further interesting comparisons that should be understood by the users, taxpayers and public generally. In order that the merits of the respective methods may be weighed so as to determine what the best plan for the community may be.

To handle the city's combined load by the jitney alone, some new problems are presented, as from 1,500 to 1,800 jitneys will be required during the maximum rush hour.

New elements will enter into the operation, some of which will have a tendency to raise present operating costs. The service will have to be organized under a corporation or central control in order that the outlying and sparsely settled non-paying section will receive necessary service, and such a larger force of men will call for a systematic and close supervision in order properly to schedule and control the service.

This will require a well-organized force of supervisors as between 2,250 and 2,700 drivers alone will be employed. Accidents and insurance costs will rise, and schedule speed will be decreased on account of the congestion.

Our report shows that the longer haul of the car rider, on the present jitney fare basis, calls for an 8.67-cent fare. With these increases in operating costs, it is safe to say that with the whole city covered, the fare will have to be very close to 10 cents. This will bring the riders' annual bill up to \$4,000,000, or about \$1,500,000 more than the railway charges under the present rate of fare.

Other items of expense should be considered, even though they may be indirect. Many streets now unpaved will have to be improved in order to permit of the extension of this method of service. This item is likely to run into large figures, and will all be at the expense of the property owners and the city.

In addition to this, increased wear and tear on the streets already paved will result from the tremendous increase in traffic. More traffic officers will be necessary to control the increased traffic. All of these items will increase the cost of operating the municipality, and must be met by increased taxation, so that these indirect costs will still further augment the total cost of the city's local transportation should the jitney be adopted.

With the great number of jitneys on the streets, the congestion will become most acute, especially in the downtown business district, and all traffic will be retarded, including that of jitneys itself. Thus it will lose a portion at least of what is now its chief asset—fast speed.

At the intersection of Travis and Franklin the 146 street car movements through this intersection will require 1,946 jitney movements per hour to give the same passenger capacity. The present vehicular flow at this intersection is 1,314 per hour. By combining the two, 3,260 vehicular movements result. This will give a fair idea of conditions that will pertain to this and the other downtown corners under the jitney method.

On the other hand, properly to care for the jitney passengers in addition to its present patronage, it will be necessary to place in daily operation twenty-eight additional cars.

The cost of the improvements as specified in our report to the Mayor and Commission Council, submitted Nov. 5, 1923, and the establishment of the bus line to Southmore, is estimated to be \$438,000. Concerning the other extensions of service that may be desirable, the cost and effect upon the company's net earnings must be given consideration, as capital expenditure must not be allowed to expand too rapidly.

The time required to obtain new cars, construct the additional track and remodel the present equipment, recommended in our report, will require from six to eight months. As these are necessary to the complete carrying out of the revised plan, the full benefit resulting from the operating economies cannot be obtained until this is done. Therefore, steps should be taken to secure these improvements forthwith.

Since 1913, the net income has not been what it should be to insure the perpetuation of the system as the relation of capital to operating revenues and net earnings fails to follow proportionally the investment as shown in the record cost, and which it must do if the system is to continue to remain self-sustaining.

In making all future additions to the plant and equipment and extending the service, we cannot emphasize too strongly that extreme care must be exercised by the city to see that the capitalization of the company is not unduly expanded; this is especially true in connection with the building and operating of the extensions. At present the company is operating nineteen lines. Twelve of these lines are not self-sustaining. Six of these lines are operating in sparsely settled districts; some of them have been losing money for years, and many undoubtedly will continue to do so indefinitely.

The remedy, as we have already pointed out, lies in combining and co-ordinating the two methods into one comprehensive plan of transportation. These two forms of transportation should not be competitive and destructive, so that one system breaks down the other, but in every case the method best suited to the requirements of the section to be served should be employed. Thus under proper regulation a broad and constructive policy may be adopted, making practical economical and efficient operation of this important public utility. This will build for permanency and future development of the city's transportation requirements.

Should the city see fit to adopt the suggestions we have made, and relieve the railway of the jitney competition, then there will rest upon the company a most sacred duty to furnish rapid, ample efficient service, commensurate with the traffic demands of this city. Failure upon the part of the company to do this will invite a return of jitney competition and will constitute on the company's part a flagrant violation of the solemn obligation which it owes the public.

Reading Rejoices

READING TRANSIT & LIGHT COMPANY'S CONTRIBUTION TO THE RECENT CELEBRATION COMMEMORATING THE ONE HUNDRED AND SEVENTY-FIFTH ANNIVERSARY OF THE FOUNDING OF THE CITY OF READING, PA.

The recommendations for additional street car service in the event jitney traffic is discontinued include increased service by large one-man cars on the West End-Pierce, Heights-South End and Harrisburg and Central Park lines and by small one-man cars on the North Main-Leeland, Woodland-La Branch and Mandell-North Main lines. This would add twenty-six cars and 204 car-hours to the daily schedule.

The estimated cost of improvements which, it is asserted, should be made right away, is given as follows:

Building 3.66 miles of track with necessary connections and special work, \$163,000.

Purchase of fifteen double-track one-man cars, \$180,000.

Remodeling platforms and doors of fifty-three cars to permit separate entrance and exit of passengers, \$45,000.

Purchase of five modern buses with garage facilities, \$50,000.

Only an Eight-Cent Fare Will Save Buffalo Company

Unless the International Railway, Buffalo, is permitted to charge an 8-cent fare on its local lines, the company will face a deficit of \$145,900 the next fiscal year. Witnesses for the railway testified to this effect before the Public Service Commission at the resumption of hearings on its plea for a higher rate of fare in Buffalo. It was testified that if an 8-cent fare is charged in 1924 the net income of the International would be \$419,000. The present fare of 7 cents, or four tokens for 25 cents, would yield the International, it was testified, an operating income of \$10,935,700, while an 8-cent fare would yield an operating income of \$11,530,900. Gross income on the present 7-cent fare next year was estimated at \$1,383,000, as against \$1,958,400 on an 8-cent fare.

Additional evidence tending to support the company's claim that its system is valued at \$98,000,000 was presented by expert witnesses for the railway. A. E. Hibner, valuation manager of the International, and W. K. Meyers, vice-president of finance of the Philadelphia (Pa.) Rapid Transit Company, were among the witnesses. Mr. Hibner testified that the reproductive cost of the entire International system, including interurban lines, would exceed \$100,000,000.

One-Man Cars and No Transfers Saves Brooklyn Line

The Transit Commission, acting under the authority of Chapter 748 of the Laws of 1923, has issued a special permission to the Nassau Electric Railroad of the B.-M. T. system to operate the Park Avenue Line, in Brooklyn, without transfers, for another year from Nov. 2, 1923.

Last year, acting under authority of a legislative act of 1922, the commission authorized the company to reopen the line for service after a shutdown of about two years, following the strike of 1920. Receiver Garrison was directed by the courts not to resume operation of some of the deficit-making lines. Hence the Park Avenue line was shut down until legislative enactment permitted its resumption with one-man cars without the extra expense of a widespread transfer system.

The line begins at Central Avenue and Cooper Street and terminates at

the Sands Street, Brooklyn, end of the Brooklyn Bridge. It issues and accepts transfers good across the Brooklyn Bridge, a total ride of about 6 miles from Manhattan to the Bushwick terminus.

Freight Service to Be Continued by Wisconsin Road

The Eastern Wisconsin Electric Company will continue to furnish freight and express service between Neenah and Fond du Lac in connection with its interurban passenger service. This service, recently established, aroused the ire of business men and residents of the city to ask the Council for its abolishment on the score that further operation of this service through the main business district was detrimental to the well being of the city and lowered abutting property values. Representatives of business houses suggested that the company build a suitable terminal in the outskirts.

Urges Washington Traffic Study

Appearing before the United States Senate committee on traffic of the District of Columbia on Nov. 20, J. Rowland Bibbins, consulting engineer, Washington, D. C., recommended that a thorough engineering survey of traffic and transportation in the district be made. The object would be to determine basic facts now entirely unavailable which would be obtained to inform Congress and the District of the need for improvements and for use in working out a definite program fundamentally sound as well as flexible. A similar recommendation had already been made to the committee by W. F. Ham, president Washington Railway & Electric Company. Mr. Bibbins urged that this survey should be made under the jurisdiction of the engineer-commissioner of the District so that the fund of engineering data already in the hands of the commission could be utilized and continuity of effort thus be secured.

Mr. Bibbins urged that Washington should take the lead in solving its traffic problems as it has been looked upon as the model city of America. In common with all other cities, Washington is faced with the necessity of devising ways to speed up the movement of street cars and vehicles generally.

Rail Service Replaced by Bus

At a recent meeting of the City Council of Streator, Ill., the Public Service Company of Northern Illinois was granted permission to cease railway operation and tear up the tracks of the Illinois Light & Traction Company. As stipulated in the agreement the Public Service Company guaranteed satisfactory bus service for the next five years. At the same meeting an independent company, known as the Yellow Bus Company, was authorized to take up operation with a view toward supplying the citizens with adequate bus serv-

ice. If this company fails in its attempt, the Public Service Company of Northern Illinois will see to it that some other bus operator gives service in the community. The railway in Streator is one of the oldest in Illinois. It established service thirty-three years ago.

Bus System Proposed for Jersey Shore Towns

Application has been made to the Board of Commissioners for permission to operate a \$200,000 intercity bus system at Asbury Park. The applicant was George B. Cade, assistant to the secretary of the Atlantic Coast Electric Railway, operating from Pleasure Bay to Sea Girt and the belt system at Asbury Park. The application was made for the Atlantic Coast Transportation Company, a subsidiary of the Atlantic Coast Electric Railway, the officers of which will comprise the personnel of the new concern. It is said that the plans for operating buses include four intercity systems. Mr. Cade said that operation of the railway belt line service in Asbury Park may be suspended during the winter months and buses substituted.

Use of Bus Planned by Hartford & Springfield Line

J. T. Hambleton, general manager of the Hartford & Springfield Street Railway, has asked the city transportation board of Springfield, Mass., for a franchise to operate buses from that city to Suffield, Conn., in place of trolley cars, operation of which it is proposed to discontinue north of Suffield. This is said to be the first step in a plan for the installing of buses over the entire west side route of the Hartford & Springfield, thereby enabling the company to end the railway service and remove the tracks and wires which furnish connections between the Springfield Street Railway and the lines of the Connecticut Company on the west side of the river.

Mr. Hambleton told the transportation board that the entire equipment on the west side was becoming unfit for use and that the company had no funds for replacements. Earnings of the company so far this year are only 70 per cent of the earnings last year. He asked for a quick decision by the city.

The proposed arrangement is subject to approval by the receiver, H. B. Freeman, Hartford, and the bondholders, but no objections are anticipated from these sources. The Springfield Street Railway has indicated that it will not object to the proposed bus service provided it does not offer competition with that company between Springfield and Suffield.

Mr. Hambleton has received encouragement from the Springfield authorities, and he believes the Agawam, Mass., and Suffield, Conn., Selectmen will give their approval, in which event it is hoped the bus service can be started by Dec. 1.

Personal Items

H. C. De Camp Leaves Dayton

**Former Assistant General Manager to
Devote Himself to Promotion of
One-Man Car Operation**

H. C. De Camp, the work for which he went to Dayton, Ohio, completed, has resigned as assistant general manager of the City Railway to promote the efficient and economical operation of one-man cars. The Dayton work consisted of converting the system there to 100 per cent one-man operation, with double-truck cars. Upon it Mr. De Camp entered in July, 1921, and physically the change had been made by June of this year, but a few touches still remained then to perfect operation with the new equipment.

SERVICE SAVED TO DAYTON

Between the dates mentioned more than twenty-six cars were rebuilt, and all other details were worked out successfully which go with a physical change of this magnitude. Economies in management had to be introduced if the City Railway and a 5-cent fare were to be saved to the people of Dayton. Through the change to one-man operation it was possible to reduce the number of trainmen from 240 to 126, replace all regular runs on a car-for-car basis and add trippers so that service to the public actually was bettered.

The story of this change in equipment to one-man operation as carried out at Dayton is a mighty interesting one. Mr. De Camp himself was induced to tell it for the benefit of others in an illustrated article which appeared in the *ELECTRIC RAILWAY JOURNAL* for Nov. 10, page 809.

Before going to Dayton Mr. De Camp had been with the railway department of the Westinghouse company in the Cincinnati office for eleven years. So long had he been engaged in production that even those who knew him well had come to look upon Mr. De Camp primarily as representing the sales end of the business.

MR. DE CAMP AN AUTHOR

As a matter of fact the transportation end of the business has always had a strong appeal for him, and he has a fund of both railway operating and selling experience at his command. He started with the General Electric Company several years ago, but later went over to the operating end, serving with the old Utica & Mohawk Valley Railway, the Brooklyn Rapid Transit and the Third Avenue Railway. Then followed his long sales connection. During all that time, however, Mr. De Camp kept up his interest in the operating field, particularly along the lines of efficiency in management.

Mr. De Camp has never lost the common touch, as Mr. Kipling puts it. He has always felt that the trainmen have received less attention than they deserved and so he wrote a series of "Letters of a Retired Motorman to His Son." If it is a test of literature to strike a sympathetic chord, then these letters come pretty close to being literature. Ever since he has been in the Central West Mr. De Camp has been active in the affairs of the Central Electric Railway Association. At the 1920 cruise of the association he was "parson," and at the meeting last January he presented the paper "Emer-

H. C. De Camp

gency Stops," which resulted in the tests made later near Indianapolis and reported in the *ELECTRIC RAILWAY JOURNAL*.

A. S. Coleman, manager of the Alabama Power Company's office in Gadsden, has become district manager at Montgomery. He has been succeeded at Gadsden by J. O. Henkel, Jr., who has been manager of the eastern division at Anniston.

George W. Scott has succeeded Ralph Chandler as second vice-president of the Phoenix Railway, Phoenix, Ariz. L. M. Ford is now treasurer, replacing A. D. Haskell, acting in that capacity. Both officials are located in Los Angeles.

Charles B. Cooke, Jr., has succeeded Franklin P. Jones as president of the West Chester Street Railway, West Chester, Pa. Thomas L. Hodge has been made treasurer, replacing M. G. Woods:de.

Robert J. Costigan is claim agent of the Trenton & Mercer County Traction Corporation, Trenton, N. J. The duties of claim agent were formerly performed by Edward J. Peartree, general manager.

John N. Duerr, North Tonawanda, has been promoted to the position of gen-

eral superintendent of the Buffalo-Lockport interurban division of the International Railway, Buffalo. Mr. Duerr has been in the employ of the International for twelve years. For some time he has been assistant superintendent of the Buffalo-Lockport division.

W. H. Evans, Wilkes-Barre, has been selected as the general superintendent of the Williamsport Passenger Railway and the Jersey Shore Street Railway. The position has been vacant more than three months.

W. Stewart has been made assistant treasurer of the Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va.

M. J. Binkley has been made secretary of the Buffalo & Lake Erie Traction Company, Erie, Pa.

F. A. Clark will resign as superintendent of power of the City Light & Traction Company, Sedalia, Mo., to take a position in the construction department of Henry L. Doherty & Company at Washington, Pa.

Douglas Shaw, Madison, treasurer of the Wisconsin River Power Company, Madison, formerly vice-chairman of the accounting division of the Wisconsin Utilities Association, was elected chairman of that division at the closing session of a two-day conference of heads of accounting departments, held in Madison, on Oct. 23 and 24. He succeeds Emil Jorgenson of the Wisconsin Gas & Electric Company, Racine, who recently tendered his resignation.

Rawson Collier, for some years prominently connected with the Georgia Railway & Power Company, but for the past two years with the Hudson River Gas Company, Poughkeepsie, N. Y., has resigned the latter post and will return to Atlanta as representative for Dwight P. Robinson & Company. He is a brother of Charles Collier, sales manager for the Georgia Railway & Power Company.

Obituary

Edward C. Crosby, former builder of street railways in Vermont and Massachusetts, died in Brattleboro, Vt., on Nov. 2. He was born in Marlboro, Vt., in 1846. In 1895 he built the Brattleboro Street Railway and in 1897 the Springfield (Vt.) Street Railway. In the early '90s he took a leading part in the building of lines from Northampton to Amherst and Greenfield, Mass. When several of these roads were combined in the Connecticut Valley system he became chairman of the board of directors. He represented Brattleboro in the Legislature in 1912 and was elected State Senator last year.

James W. Sale, president of the Marion & Bluffton Traction Company since 1914, died recently at Easthaven Hospital, Richmond, Ind. He was sixty-five years old. Aside from his con-

nection with the Marion & Bluffton Traction Company, Mr. Sale was prominently identified with other business enterprises throughout the state and was active in politics.

Samuel W. McCall, ex-Governor of Massachusetts and a member of the board of public trustees of the Eastern Massachusetts Street Railway, died recently at Winchester, Mass.

William J. Lloyd, general superintendent of the West Lynn works of the General Electric Company, died suddenly on Oct. 28 in an automobile as he and friends were entering the grounds of the Tedesco Country Club. For several years he was connected with the Westinghouse Company, but for the past twenty-five years he had been with the General Electric Company, four years of this period being spent at the plant of the British Thomson-Houston Company at Rugby, England. Mr. Lloyd for several years was at the Pittsfield works of the General Electric Company and about twelve years ago was transferred to Lynn. He assisted in establishing a plant of the company in Australia about four years ago, returning again to the Lynn works. In July, 1922, he was made general superintendent of the West Lynn works.

Clifford Thorne, noted attorney and authority on railroad subjects, died in London on Nov. 13. Mr. Thorne was a member from 1910 to 1917 of the Iowa Board of Railway Commissioners and chairman for the last five years of his service. He was president of the National Association of Railway Commissioners in 1914 and 1915. He was a member of the American Bar Association, of the American Economics Association and the American Academy of Political and Social Science. Mr. Thorne's expertness in questions of economics brought him into prominence as a contributor to various magazines.

Changes Proposed in New York Rapid Transit Routes

The Board of Estimate of New York has before it a proposal for changes in the route of the West Side extension of the Brooklyn-Manhattan Transit Corporation subway that have been adopted by the Transit Commission. If the board approves the modifications the new subway will be constructed under Central Park instead of under Central Park West, and will go north between 110th and 125th Streets under Eighth and St. Nicholas Avenues instead of under Manhattan Avenue. It is estimated that the change will result in a saving of \$2,500,000 to the city. The Transit Commission has also modified the West Side route so that it will extend from its original terminus, 162d Street, under St. Nicholas Avenue to Fort Washington Avenue at West 175th Street. The line will have four tracks and be under ground all the way. To be effective, these changes must be ratified by the Board of Estimate, which is expected to act on the new proposals some time next week.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Railway Supply Manufacturers Will Hold Convention

At a meeting of the executive committee of the Railway Supply Manufacturers' Association, held in conjunction with the American Railway Association, mechanical division, Master Car Builders-Master Mechanics, held in New York City on Nov. 8, 1923, it was mutually arranged that a convention and exhibition would be held in Atlantic City, N. J., June 11-18, 1924.

Slack Demand for Steel Castings

October bookings of steel castings by companies representing more than two-thirds of the commercial-castings capacity of the United States amounted to 37,446 tons, as against 47,574 tons in September. The accompanying table shows the bookings of commercial steel castings for the past ten months by sixty-five identical companies, with a monthly capacity of 96,900 tons, of which 38,300 tons are usually devoted to railway specialties and 58,600 tons to miscellaneous castings.

Month 1923	Total		Railway Specialties	
	Net Tons	Per Cent of Capacity	Net Tons	Per Cent of Capacity
January.....	100,605	103.8	47,879	125.0
February.....	90,152	93.0	39,845	104.0
March.....	143,564	148.2	76,409	199.5
April.....	90,968	93.9	39,610	103.4
May.....	89,493	92.4	38,788	101.3
June.....	84,878	87.6	42,773	111.7
July*.....	52,066	53.7	16,741	43.7
August.....	50,515	52.1	18,332	47.9
September.....	47,574	49.1	21,685	56.6
October.....	37,446	38.6	9,840	25.7

* Two companies with a capacity of 785 tons per month on miscellaneous castings now out of business.

October Cement Output Sets Record

The production of portland cement in the United States during the month of October was greater than in any other month this year or during 1922. Compared with the same month a year ago, the figures were 13,350,000 bbl. for 1923 and 12,287,000 bbl. for 1922. In fact, the total production for the first ten months of 1923 is very nearly equal to that for the whole of the year 1922.

Heavy Shipments of Paving Brick Continue

According to the National Paving Brick Manufacturers' Association the paving season is running later in the fall this year than is customary. This is indicated by the continued heavy shipments of vitrified paving brick for the month of October, which were 34,287,000 as against 34,761,000 for September. Total number of brick manufactured was 34,317,000 for Octo-

ber and 34,457,000 for September. Stock on hand was reported at 76,613,000 for October as against 86,530,000 for September. It is thought that this unusual fall activity is the result of a wet spring and a late start to the paving season.

Maintains Carbolineum Is Always Available at Fair Price

The Carbolineum Wood Preserving Company, Milwaukee, Wis., has written the editors of the JOURNAL commenting that it was gratifying to note in the report of the American Electric Railway Engineering Association wood preservation committee, published in the JOURNAL, that the committee confirmed the report of the previous committee in acknowledging carbolineum as the most suitable preservative for brush treatment of wood poles. The manufacturer wished to differ, however, with a subsequent statement made by the committee that carbolineum was not always obtainable at a reasonable cost.

The manufacturer states that, calculating at the highest prices for carbolineum and labor, the cost of brush treating a pole is not more than 50 cents. When it is considered that the pole costs from \$7 to \$10, at present, and that the brush treatment will give an additional life of at least 100 per cent under the most severe exposure, the 50 cents extra cost for brush treatment, even at highest prices, is certainly justified. The manufacturer says that it is difficult to understand why any one should try to economize in this process by using a cheaper material. It is claimed that in many years' experience customers of this company have rarely objected to the price. In ninety cases out of a hundred they have simply asked for the manufacturer's standard material.

Metal, Coal and Material Prices

Metals—New York		Nov. 20, 1923
Copper, electrolytic, cents per lb.....		13.00
Copper wire base, cents per lb.....		15.50
Lead, cents per lb.....		6.90
Zinc, cents per lb.....		6.25
Tin, Straits, cents per lb.....		44.875
Bituminous Coal, f.o.b. Mines		
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons.....		\$4.425
Somerset mine run, Boston, net tons.....		2.375
Pittsburgh mine run, Pittsburgh, net tons..		1.925
Franklin, Ill., screenings, Chicago, net tons..		1.45
Central, Ill., screenings, Chicago, net tons...		0.85
Kansas screenings, Kansas City, net tons...		2.00
Materials		
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.....		\$6.50
Weatherproof wire base, N. Y., cents per lb.		16.50
Cement, Chicago net prices, without bags..		\$2.10
Linseed oil (5-bbl. lots), N. Y., per gal.....		\$0.94
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots.....		11.25
Turpentine, (bbl. lots), N. Y., per gal.....		\$0.94

Rolling Stock

Schenectady Railway is overhauling most of its equipment. Many cars are in the shops being entirely rebuilt except for the steel underframe. New bodies will take the place of the old.

Southwestern Traction Company, Temple, Tex., has remodeled its passenger cars, converting them into one-man cars with a pay-as-you-enter feature. The converted cars were put in operation on Nov. 5.

Des Moines City Railway will receive in December the first of the twenty-five new steel cars ordered some time ago.

Montreal Tramways has purchased fourteen one-man Birney safety cars from the F. B. Cutter Company, New York City. These cars are the first of this type to be put in service in Montreal.

Department of Street Railways, Detroit, has placed orders for 100 new Peter Witt type cars which are to be equipped with safety car devices and are generally similar to the other cars of this type recently purchased for Detroit. The order has been divided equally between the McGuire Cummings Manufacturing Company and the Osgood Bradley Car Company. Delivery starting Feb. 28, 1924, is specified. The principal specifications follow:

Seating capacity	52
Bolster centers, length	23 ft. 9 in.
Length over all	48 ft. 5 1/2 in.
Width over all	8 ft. 4 1/2 in.
Height, rail to trolley base	10 ft. 9 1/2 in.
Body	Semi-steel
Interior trim	Cherry
Headlining	Agasote
Roof	Arch
Air brakes	Not settled
Car signal system	Faraday
Control	K-35
Curtain fixtures, Curtain supply No. 88	Ring
Curtain material	Double-faced Pantasote
Destination signs	Hunter
Door-operating mechanism	
.....	Safety Car devices
Door engines	National pneumatic
Door signals	
National Pneumatic safety interlocking	
Fenders or wheelguards	H. B.
Hand brakes	Peacock staffless
Heater equipment	Gold nichrome wire
Headlights	H.D.B.-96 Root type
Lighting	Center with Electric Service
.....	Supplies fixtures and shades
Motors	Four G. E. 35 hp.
Paint	Pratt & Lambert
Sanders	Osgood Bradley
Sash fixtures	O. M. Edwards
Scrapers	Root No. 7 air operated
Tail lights	Nichols Lintern duplex
Trolley catchers	Ohio Brass No. 13141
Trolley base	Ohio Brass Company
Thermostat	Railway Utility
Trucks	Taylor
Ventilators	Railway Utility
Wheels	Rolled steel
Watt-hour meter	Sangamo

International Railway, Buffalo, has equipped 100 passenger cars on its local lines with scrapers or small snow plows which can be lowered to the rails during the winter as necessity arises. Announcement of this valuable addition to the company's snow-fighting equipment was made by Herbert G. Tulley, president of the International. Each line will be equipped with its share of these cars, so that the scrapers can be brought into play immediately snow starts to fall. The company's snow-fighting equipment, in addition to these

cars, consists of fifty-four plows and sweepers. These have been thoroughly overhauled and are now assigned to the various carhouses throughout Buffalo for immediate service.

Track and Line

Philadelphia Rapid Transit Company has placed an order with the Union Switch & Signal Company for the material required for installation of an electro-pneumatic interlocking plant at Fortieth Street, on the Market Street Elevated Line. The interlocking consists of a crossover layout with complete signal protection and automatic stops involving eight working functions. Two of the signal levers will be equipped with Mercury automatic time releases to provide automatic time locking.

Southern Public Utilities Company, Winston-Salem, N. C., is making an extension from the end of the West Highland line to the Richard J. Reynolds High School.

New York, N. Y.—The Transit Commission has received bids for the construction of the tracks in the Jerome Avenue yard of the Interborough Rapid Transit Company near Jerome Avenue and Moshulu Parkway. The Slattery Engineering & Construction Company was the low bidder, offering to do the work at \$59,879.

Jackson Railway & Light Company, Jackson, Tenn., has spent \$70,000 this year in improving its track, buying new equipment and laying extra heavy rails. The East Jackson line, from Royal and Main Streets to the end of the line on East Preston, has been completely rebuilt. Extra heavy rails have been laid on Arlington Avenue from Highland to Prospect and a new curve has been built into the line at the corner of Arlington and Prospect. The North Royal line was also completely rebuilt. The superintendent recently announced that all track improvements for the year had been completed.

Power Houses, Shops and Buildings

West Jersey & Seashore Railroad, Camden, N. J., will purchase power hereafter from the Philadelphia Electric Company. Electricity generated in Philadelphia will be turned into the West Jersey & Seashore Railroad's third-rail line between Camden and Atlantic City early in December. Railroad officials more than a year ago found it would be cheaper to purchase power from the Philadelphia Electric Company, convey it to New Jersey over high-tension lines on the Delair Bridge and run it through substations to the railroad line than it would be to continue the generation of electricity at Westville, N. J. Part of the Westville plant will be used as a substation.

Trade Notes

Templeton, Kenly & Company, Ltd., Chicago, almost immediately after the quake had subsided, received cablegrams to rush to Japan quantities of No. 329 Simplex pole-pulling and pole-straightening jacks, which they were partially able to do through the stock maintained at San Francisco and by borrowing from the stocks of the Western Electric Company and other jobbers on the coast. Additional quantities were immediately dispatched from Chicago to San Francisco, and it is safe to predict that the telephone and power lines will be quickly restored through these first-aid tools.

William Porter White has been appointed to act as personal assistant to M. O. Troy, new executive assistant manager of the central station department of the General Electric Company. His headquarters will probably be at Schenectady in common with Mr. Troy. Mr. White is a graduate of Clemson College, class of 1906, whence he entered the student test course at the Pittsfield works of the General Electric Company. In 1908 he started work in the transformer engineering department there, where he received a thorough training in designing. In 1911 he was transferred to the transformer sales department at Schenectady and, in 1912, was placed in charge of exploitation and sale of feeder voltage regulators and generator voltage regulators. He received another promotion in 1913, taking charge of commercial engineering work in the transformer sales department at Pittsfield.

Bridgeport Brass Company announces the appointment of E. E. Helm as district manager at Detroit. Mr. Helm comes from Akron, where for two years he was manager of the Industrial Bureau of the Akron Chamber of Commerce. He is particularly well known in rubber and automobile trade circles by reason of his connection for five years with the Goodyear Tire & Rubber Company in publicity work.

New Advertising Literature

International Steel Tie Company, Cleveland, has issued a thirty-two page booklet on "Joints." It gives the laboratory and service data on the strength of rail joint on steel twin ties. The articles contained in the leaflet are reprinted from a recent issue of the ELECTRIC RAILWAY JOURNAL.

United Electric Company, Canton, Ohio, has issued a pamphlet, "Vacuum Cleaning Data for Architects and Engineers." The pamphlet states that the lack of a ready reference work on vacuum cleaning has been felt by architects and engineers. The demand for this compilation of information is evidenced, in the opinion of the company, by the fact that this pamphlet has reached its fifth edition.

HENRY W. BLAKE and HARRY L. BROWN, *Editors*

View the Bus in Its Place

WE HEAR a lot about the bus—and perhaps rightly so. Like the faithful colored servant, it is a very helpful adjunct, if kept in its place. And like that servant it may “talk up” out of all proportion to its importance, relative to the master of the situation, the electric railway.

To be specific, the bus in 1922 was 0.09 per cent as important to the general public as the electric railway. It carried nine-hundredths of 1 per cent as many revenue passengers as did the trolley—in figures, 11,852,726 on the bus and 12,665,300,050 on the electric railway—eleven million against twelve billion—according to the Bureau of the Census.

But that was 1922, the bus enthusiast will say. Well suppose we allow a 100 per cent increase in bus passengers carried for the year 1923, which is known to be a very generous allowance. And suppose the railways hauled no more passengers in 1923 than in 1922. On this basis of comparison the bus in 1923 will have carried 0.18 per cent as many passengers as the electric railway—less than two-tenths of 1 per cent.

These figures show clearly the place of the bus in transportation importance. It is a tiny infant as yet, though growing with remarkable rapidity. But what an extravagant statement one makes when he says the day of the trolley has passed.

Insurance Is Good—

Fire Prevention Is Better

FIRE insurance is a tremendously important thing for all electric railway companies, and they should be very certain that their properties are adequately protected—a condition, strangely enough, which often does not exist. But even more important than the assurance that the physical property loss will be reimbursed in case of fire, is the need for effort and attention expended in the direction of preventing fires. The fire insurance collected does not reimburse a company for the loss of revenue which occurs during the four months to one year period that may elapse before the property burned (cars, for example) can be replaced; nor does it compensate the public for the loss of service which it must suffer.

This is all by way of emphasis of the necessity for a regular inspection of the fire protection facilities installed on most railway properties and of the general housekeeping conditions over the property. For example, on a recent check-up of the conditions on a street railway system, it was found that only three automatic fire doors worked out of ten tested. A test of the company supplying the watchman service, wherein the regular ring-in at several boxes was skipped, failed to bring any response from the company for over an hour. Various other conditions were found over the property which not only contributed seriously to the fire hazard existing, but would have been cause for a material increase in the insurance rates on various pieces

of plant, had they been discovered by the insurance company's inspectors. It is a comparatively simple thing to install fire alarm systems, sprinkler systems, watchman protective service, automatic fire doors, and various other devices for minimizing the danger of fire. It does not take any great amount of managerial ability to get these things installed. But unless the manager supplies the incentive for eternal vigilance in keeping these things in working order they are of little use, and the company might better have saved the investment.

Every railway property should have a periodic, systematic check-up on the fire conditions. Fire prevention is the thing—insurance only for the truly unavoidable fire. Such a policy is always reflected in the rates a company is required to pay.

Transportation Field Needs to Be “Sold” to Faculties

LIKE some investment bankers who recommend today to their clients that electric railway securities should be avoided, the faculties of some of the universities are very lukewarm, if not completely negative, about the opportunity which the transportation field offers for young college trained men. Both classes of men are not keeping up with the progress made in this field in the last three years. The attitude of the bankers merely makes money a little harder to get, but this attitude on the part of faculties tends to deprive the transportation industry of a supply of good personnel for taking over the active positions of the industry in the future. The latter is the more important concern, for with the proper brains in the field, the money problem will take care of itself.

In view of all the advertising that has been given to the troubles of the industry it is rather natural, of course, that people not closely in contact with the everyday developments in the transportation field should at the present time have the idea that the field is not a promising one for the young man to enter. But while this impression is explainable, the industry should not be satisfied to permit it to continue, as there has been such a decided change for the better.

The airing given to transportation troubles was necessary as the only means of bringing about a public realization that conditions fundamentally wrong had to be corrected. The process of education thus given so much momentum by the dire necessity of the situation, has had a profound effect in the course of these few years in building up a public understanding of transportation. This has again placed the industry in a favorable position.

Furthermore, the transportation problems of the present day are so great and so varied, and they are increasing so much each year, that this industry offers opportunities for the exercise of engineering, financial, administrative and legal skill and vision beyond parallel in almost any other line of endeavor. The whole

fabric of industry in the United States is so thoroughly interwoven with transportation that its development is bound to continue at a very rapid rate—and in a much more enlightened way in the future in view of the public knowledge on the subject that has been gained. The United States already has more transportation facilities than any other nation in the world, yet with the advent of the motor bus and motor truck we have only made a beginning to date in comparison with the development that is in prospect during the next twenty-five years.

The steam railroads and the electric railways are going to make extensive use of the gasoline propelled vehicles, and the automotive industry sees this and is lining up with these major transportation agencies for the policy of co-ordination of the various transportation facilities. In addition there is coming a truly remarkable use of automotive vehicles in fields not now served by rail transportation, and independent of the railway companies. A vital aid to this development is the rapidly spreading acceptance of the philosophy that transportation is too vital a public service to permit its destruction through competition, and therefore development will be aided by the sounder doctrine of utilizing each kind of transportation in its proper sphere in relation to the other kinds, in order to secure the most economical results while supplying the kind of service demanded by the public.

All of this active development simply points to the great need for the highest caliber of men—which means, that transportation holds forth an attractive future for the young college graduate.

The Light-Weight Car Is Revolutionizing Light Interurban Practice

THERE was a time when no interurban operator would consider the use of any equipment but that of a heavy type similar to steam railroad coaches. These cars had motor equipment geared for speeds of 50 m.p.h. or even higher, but on many properties the trolley voltage fell so low due to heavy draft of current that the maximum speeds attainable in ordinary service were far below this. The heavy cars also proved very destructive to track and roadbed.

A much saner view of light interurban service has been taken in recent years. The principle of the light-weight car, so successful in city service, has been applied with equally good results in the interurban field. The use of one-man operation in interurban service has also been found entirely practical on many lines, introducing a substantial economy. It has been found that a car with properly designed entrance and exit can save time at stops, and by virtue of a large reduction in weight, the motor capacity can be made less and high rates of acceleration and reasonable running speed can be attained without excessive line drop. This in turn often gives an actual improvement in the average schedule speed. For example, it has been found in practice, as noted again in an article in this week's issue, that a certain type of car embodying these improvements, and having a rated maximum speed of 45 m.p.h., could make the same schedule as the old heavy type geared for 60 m.p.h., and with somewhat more leeway. Furthermore, the material reduction in energy consumption, when a line is operated with the light cars, often avoids the necessity, which the company faced with its old cars, of increasing power plant and substation capacity. Or if power is purchased, the light cars make possible not

only a saving in the energy consumption, but they also reduce the maximum demand charge.

Every interurban manager using heavy cars will do well to study the results indicated in the article on page 927, and see if a similar plan for improved operation can be applied to his property. The use of these light cars is spreading at a remarkable rate. They afford an opportunity to give the public better service because of their lower operating cost; and more frequent headway will almost invariably create additional riding. More than one interurban that was a financial failure when operated along old-time methods has been placed on a sound basis and has been enabled to earn some return on the investment by getting rid of its old cars and substituting the light-weight one-man type.

Utility Debenture Bonds Are Sold on a 5½ per Cent Basis

ONE cannot read the pages of any financial paper, or the financial pages of any of our large metropolitan journals, without being impressed with the space given to public utility securities. One has only to compare this condition with that of ten or fifteen years ago to see the tremendous strides in public popularity which have been made by public utility securities as investments. Forty years ago the railroads presented the principal field for general security investment. Following this period came the industrials which now, if we include in this group the "motors," represent a large proportion of the securities whose sales are quoted on the exchanges. Up to the present most of the utility issues have been dealt in either locally or off the board in New York by investment houses, but that they are growing in public approval no one can deny. The fact that they are less subject to sudden fluctuations in business than the industrials and less affected by national labor movement than the steam railroads, commends them to the cautious investor.

In this connection there is food for thought that last month the investing public promptly absorbed an issue by the American Telephone & Telegraph Company of \$100,000,000 in 5½ per cent debentures on a 5½ per cent basis. This is a large issue, even in these days of gigantic companies and big loans, yet these bonds were simply debentures without side frills like the assumption of 2 per cent for federal income tax or the 4 mill Pennsylvania or Connecticut tax. There are not many utility companies that could hope to do as well as this, even on a smaller issue. The telephone company is a national organization with property in every city, a long record of dividend payments in the past and net earnings many times the interest on these bonds. Its securities naturally attract a better market than even those of its local subsidiaries.

Nevertheless, the success of the sale should be encouraging to all other utilities. The various telephone companies controlled by the American Telephone & Telegraph Company are subject to the same kind of regulation as the electric railways and power companies; indeed they are under the same regulators in most states. They have as customers the same people as ride on the trolley cars and use electric light. They are affected by the same economic laws in regard to the purchase of materials and the hiring of labor. If the public has come to consider telephone issues as among the most desirable investments on the market, this sentiment is likely to be reflected also in the purchase of the issues of other utilities.

This 50,000-Lb. Interurban Car of the Indiana, Columbus & Eastern Traction Company Seats Fifty-eight and Has a Baggage Compartment. Its Free-Running Speed Is 55 M.P.H.

Experience Shows Light Cars Increase Net of Interurban Lines

Operating Results Analyzed on Several Properties Over a Period of Six Years Show Material Reduction in Operating Costs as Compared with Heavy Cars—The Light Cars Take Less Power and Can Make Schedules Better—Revenue Increases Have Followed the Improvements in Service Made Possible

By C. T. DeHore

General Electric Company, Cincinnati, Ohio

MODERN light-weight cars designed especially for interurban service have now been used for a sufficient length of time so that definite results are available for comparison with previous records. In practically all cases the savings have far exceeded expectations and have shown the car of this type to be far superior to the heavy and expensive type which it replaced.

The writer's attention was directed to the subject about six years ago, when the Cincinnati, Lawrenceburg & Aurora Electric Railway put into operation seven 26,000-lb. interurban cars, equipped with four 25-hp. motors geared for 35 m.p.h. After the order was placed and while the cars were being constructed every one connected with the proposition waited "in fear and trembling" to see what had been bought and how it would perform. That is now a matter of history. The saving has run about \$40,000 a year.

After watching this installation the writer felt that there were wonderful possibilities in lighter-weight cars for all interurbans. The results obtained from actual operation from a number of installations at present under consideration are worthy of note.

In a number of instances the replacement of the heavy rolling stock with lighter-weight equipment has carried with it the abandonment of the railway company's old power plant and the purchase of power from a large central station. For instance, a small interurban road operating about 600,000 car-miles per year and using, say, 3,000,000 kw.-hr. may be generating its power in an old station for about 1.75 cents or a total

cost of \$52,500. To purchase such power at 1.5 cents from the central station would save \$7,500 per year. This might not be enough reduction in cost to justify making a change. If, however, by reducing the weight of the rolling stock the energy consumption could be cut squarely in two, the cost of 1,500,000 kw.-hr. at 1.5 cents would be \$22,500. This could not be compared with power generated in the old station at the previous rate, as the much smaller load would run up the cost per kilowatt-hour. The purchased energy for the light cars would show a saving of \$30,000 total as compared with the energy for the heavy cars from the small station, and under these conditions probably would justify the change.

On other systems purchased power has not been available, but due to the lighter load fewer generators have been used, materially cutting down the amount of coal consumed. On still others it has been possible to shut down substations completely and to reduce the number of units used in substations.

Where railway companies furnish light and power, the reduction in demand and consumption is extremely important, particularly where this business is growing and the released station capacity can be immediately put to use.

The primary object of the light-weight car is to reduce the operating costs to such an extent that better service can be given to the public, which means increased receipts and improved public relations. On some roads the business available does not warrant much increase in service, but the economies effected by

substituting car for car are very helpful in meeting bond interest.

Opposition has been shown to the so-called "light-weight" car by a great many operators, who were fearful that the car would not stand up. However, experience based on four to six years of operation of these cars has convinced the writer that such fears are ungrounded, and that the cars will stand up as well, or better, than the older heavy type of car.

In considering the "light-weight" car, it must be remembered that most of the weight saved has been in the trucks and motors, and what weight has been taken out of the body is useless weight from the standpoint of life and strength. For instance, one of the large city properties in the Central States recently purchased a number of 26,000-lb. passenger cars, seating fifty-two. It had some 33,000-lb. cars seating the same number, which were built nine years ago, and equipped with maximum traction trucks and two 65-hp. motors. It was decided to change these trucks and motors to four 25-hp. motors on 26-in. wheel trucks. This change reduced the weight of the car from 33,000 to 28,000 lb., or only 2,000 lb. more than the new light-weight car. The car builders advise that the remaining difference in weight was due to two things: First, the old car had a roof 8 in. higher than the new car; second, the excess weight of knee beams necessary to support the drop platform on the old type car.

The weights of passenger interurban cars in the Central States vary from 25,000 lb. to 102,000 lb. One truck equipped with two motors as used on some of the heavier cars weighs more than the entire car on other properties, and yet both cars are doing almost identical work. It is true that some of the heavier cars run faster than the light ones, but there ought to be some better way of getting a little more speed than to multiply the weight by four.

The number of light-weight installations has grown to such an extent that it is impossible for the writer to mention all of them or give the details of each, but the accompanying list covers a number of the interurban roads which have adopted the new idea. Specific references to some of these properties will show what results actually have been obtained.

Cincinnati, Lawrenceburg & Aurora—This is an interurban road 32.5 miles long operating half-hour serv-

ice through a thickly populated suburban territory. Seven 26,000-lb. cars equipped with four 25-hp. motors have been in operation on this property for about five and one-half years.

A recent inspection of the cars proves that they have held up well and are in excellent condition, clean and well painted. There are no signs of deterioration other than ordinary wear and tear, and their maintenance has cost less than 1.5 cents per car-mile, averaged over the entire period. For 1923 this item is at the rate of 1.45 cents per car-mile.

These cars have made a total of 2,900,000 car-miles, or 414,000 car-miles per car in the five and one-half years of operation. The schedule speed is 20 m.p.h., with the stops per mile averaging 1.5. Energy consumption is 1.63 kw.-hr. per car-mile, which includes all losses to the a.c. bus. At a cost per kilowatt-hour, including substation expense, of 1.32 cents the energy cost per car-mile is 2.2 cents. The a.c. maximum demand for six cars is 203 kw.

The operating costs per car-mile for these cars are as follows:

	Cents per Car-Mile
Maintenance of way and structures	3.55
Maintenance of equipment	1.48
Power	2.20
Conducting transportation (two-man operation)	8.68
General and miscellaneous	3.60
Total	19.51

When this property purchased the light-weight cars it also shut down its old power plant and purchased two 200-kw. automatic substations. The net cost of making the change was \$60,000. The saving per year has run about \$40,000, or a total to date of approximately \$220,000. The cars have just been equipped with safety features, and are now operated by one man.

Kentucky Traction & Terminal Company—This installation, with headquarters at Lexington, Ky., is the most interesting that has come to the writer's attention. Here was a company with a considerable amount of money invested in about 100 miles of electric railway. Bus competition suddenly developed on each of its four interurban lines. Realizing that a 36-ton two-man interurban car is a poor weapon with which to fight a 5-ton one-man bus, a very thorough investigation was begun at once of the merits and operating

LIGHT-WEIGHT INTERURBAN CARS IN USE OR ON ORDER BY ELECTRIC RAILWAYS

* On order.

† In service two months.

costs of light-weight interurban cars and motor buses. At the conclusion of the investigation it was decided to install light-weight cars, making them as comfortable and attractive as possible; to improve service by cutting headway from one and one-half hours to one hour, and to make a reduction in the rate of fare.

The results of the change were described at length in the *ELECTRIC RAILWAY JOURNAL* for Sept. 1, 1923, page 327. Some of the things that happened were that the company increased the car-miles 38 per cent, and the passengers carried increased 30.6 per cent. This was accomplished with a reduction of the ticket fares of 12.5 per cent, so that the passenger revenue was 12.7 per cent greater than before. The expenses per car-mile decreased 37 per cent, so that the net income from operation was 102.4 per cent greater with the new cars. The demand on the power station decreased 350 kw. Trains late decreased 64.2 per cent, and cars put out on account of such delays decreased 30 per cent.

The approximate cost of operation on this property is as follows:

	Cents per Car-Mile
Maintenance of way and structures	3.5
Maintenance of equipment	1.5
Power	3.4
Conducting transportation (one-man operation)	8.1
Traffic	0.5
General and miscellaneous	3.6
Total cost per car-mile	20.6

In the maintenance-of-way department prior to the installation of the light cars, the budget requirements per year were approximately 20,000 new ties. For the ensuing year, the requirement was only 9,000 ties.

Since the original installation of ten interurban passenger cars the company has purchased two additional interurban passenger cars, two light-weight interurban freight cars and twenty-seven light-weight single-truck city cars.

This property now has but one type of motor, wheel, axle, etc., for all of its forty-one new cars. All cars are operated by one man.

Cincinnati, Milford & Blanchester—This is an interurban road, 30 miles long operating hourly service. It also sells light and power. The new 30,000-lb. cars, equipped with four 25-hp. motors, have been in operation on this property for three years, with excellent results and low maintenance. These cars have averaged about 275,000 miles each and still have some of the original 26-in. wheels under them.

At the time the light cars went into operation the company also shut down its old 25-cycle power station and purchased 60-cycle power, replacing 1,100 kw. nominal rating in substations by 400 kw. The demand on the power station, which had previously required the railway company to run two 500-kw. engine-type generators, dropped to 315 kw. Since the change-over was made, the company has been able to go after the lighting and power business extensively, so that it has increased the lighting business over 200 per cent in the three years.

The cars are operated by one man with a fare-box system of collection. There are twenty-two fare zones, and no trouble has been experienced in making a schedule of 20 m.p.h. or in handling passengers.

As a result of the rehabilitation, this company has changed from a property that could not earn its bond interest to one that now pays a dividend on its common stock.

Cincinnati, Georgetown & Portsmouth—This road has about sixty miles of track; does a large carload freight business, and some light and power.

For a number of years the property has not been able to make any progress due to its obsolete power station, heavy cars and infrequent headway.

The management was changed about a year ago, and the new operators at once purchased four 12½-ton passenger cars, one express car of the same weight and four semi-automatic substations. The old plant was shut down and power purchased. The cars are equipped with safety features and are operated by one man.

This Interurban Car for the Maumee Valley Railways & Light Company Weighs 25,000 Lb. and Seats Forty-nine Passengers

The mileage has been increased about 25 per cent, and notwithstanding a considerable amount of bus competition, the railway is making a very satisfactory showing.

While the new system has not been in service long enough to make an exact comparison over a period of months, the following figures may be interesting:

	New System	Old System
Energy per car-mile, including locomotives, kw.-hr.	3.05	4.10
Cost of energy, cents per kilowatt-hour	1.21	1.74
Cost of energy, cents per car-mile	3.69	7.13
Power demand, in kilowatts	755	1,200

The reduction in power bill alone is now running at the rate of \$24,000 per annum, and in maintenance of equipment at the rate of \$3,600 per annum. These two items of saving will pay more than 30 per cent on the total investment, not considering any increased riding due to the 35 per cent increase in service. The results obtained have been so satisfactory that the company has ordered two additional cars.

Maumee Valley Railway—This company operates a belt line out of Toledo, having about twenty miles of track.

The company had been unable to make its operating expenses for some years past, and in 1921 was thrown into receivership, which lasted until December, 1922.

The old equipment was scrapped and replaced by seven 25,000-lb. cars equipped with four 25-hp. motors, single-end K control and safety features.

One-man operation was installed and six cars are now operated on fifteen-minute headway as compared to four old two-man cars on twenty-six-minute headway, an increase of about 42 per cent in service.

The public immediately showed that it appreciated the new cars and improved service by riding on them in considerably increased numbers. While the six-car schedule has only been in operation for ninety days, the indications are that the receipts have increased about 45 per cent. Serious bus competition has been encountered by this line. Whether or not the new cars and improved service, together with the new bus regulation recently passed by the Ohio State Legislature,

will curtail bus activities remains to be seen. If they do, this road will be able to pay its way and further increase its rolling stock and improve its service.

Some of the comparative figures are given below:

	Old Cars	New Cars
Number of cars in operation	4	6
Headway, minutes	26	15
Operating costs, cents per car-mile	33	23.5
Receipts per month, approximate	\$8,000	\$11,500
Expenses per month	8,250	8,100

The results have been so satisfactory that the directors have authorized the purchase of three more cars.

Western Ohio Railway—This was the first high-speed line to adopt the light-weight cars. The cars weigh 34,000 lb., seat forty-eight people, are equipped with four 35-hp. motors and have a free running speed of 45 m.p.h. They make a schedule speed of 25 m.p.h. in local service and 31 m.p.h. in limited. They have been

An Interior View of the Indiana, Columbus & Eastern Interurban Car

in service now for more than a year, and the average energy consumption at the car is running 1.27 kw.-hr. One rotary in each substation is now shut down, making a further reduction in power cost. A considerable reduction has been made in maintenance costs, both for labor and for material.

The running time has been cut slightly from what it formerly was. Even with this change the light cars geared for a maximum speed of 45 m.p.h. hold to the schedule better than did the old 35-ton cars geared for a maximum speed of 60 m.p.h. This is due to better line voltage, faster acceleration and quicker loading and unloading. For instance, in one of the winter months last year, with 2,220 trains, only twenty-one trains reached their destinations late, or less than 1 per cent.

Dallas-Terrell Interurban—This is a new road, 31.5 miles long, operating 16-ton cars with four 35-hp. motors. On the interurban section, 28 miles, the run is made in one hour.

Equipment maintenance has averaged 0.6 cents per car-mile, and energy used, including all losses, is running less than 2.5 kw.-hr. The railway is well satisfied with the results obtained; in fact, they have considerably exceeded expectations.

Indiana, Columbus & Eastern—This is the largest road in Ohio, and one which has a considerable amount of private right-of-way suitable for reasonably high-speed operation. Six combination baggage, smoker and main compartment cars, seating fifty-eight,

equipped with four 60-hp. motors, geared for about 55 m.p.h. have just been put in service.

While these cars are for use primarily on the Dayton-Union City division, which is 55 miles long, they are geared so that they are capable of making limited runs on the Dayton-Columbus and Springfield-Lima divisions, where schedule speeds of 35 m.p.h. and better are maintained.

Cleveland, Southwestern & Columbus—The latest and also one of the largest interurban roads to begin the use of the light-weight car is the Cleveland, Southwestern, operating more than 200 miles of track.

The Southwestern has recently placed an order for twelve 32,000-lb. cars, seating fifty, equipped with four 35-hp. motors, geared for 45 m.p.h. These cars will completely equip what is known as the "Main Line, Western Division," running from Cleveland to Elyria, Oberlin and Wellington, a distance of 42 miles.

The company is purchasing these cars primarily in order to give better service, it being the plan to run half-hour service out of Cleveland, every other car being a limited. The cars themselves are designed to give the maximum comfort to the passenger, and no expense has been spared to get this result.

The outcome of this installation will be watched with interest all over the country, as the company is in competition with the New York Central Railroad and a large number of motor buses. The officials of the Southwestern believe that thirty-minute service in new, comfortable, easy riding cars will bring back to their road a large portion of the business now handled by private automobiles, motor buses and steam railroads. It certainly looks logical; no one knows how much patronage the buses can stand to lose, but unless all signs fail, the Southwestern is going to find out.

Other Properties—All of the other properties mentioned in the accompanying table are well satisfied with the change from heavy to light cars, and the writer does not believe there is a single instance where a return to the heavy car would be considered.

LIGHT CARS PERMIT ADDED SERVICE

The general possibilities available from the use of light-weight cars are many. Where one-man operation is used, it takes but 8 or 10 cents per car-mile additional to put on an extra car where it will relieve congestion and give real service. Such extra service reduces the number of private automobiles, and also reduces the number of "pick-ups" by such vehicles. These increased receipts gradually climb into a considerable number of dollars, and the railway companies that are in position to do these things by reason of having light-weight rolling stock are the ones that are most likely to make a profit.

A number of the installations of light-weight interurban cars mentioned in the accompanying table have been described in the pages of the ELECTRIC RAILWAY JOURNAL. Chief among them are the following:

Cincinnati, Lawrenceburg & Aurora, Dec. 13, 1919, page 915; Cincinnati, Milford & Blanchester, May 23, 1921, page 982; Kentucky Traction & Terminal Company, June 3, 1922, page 983, and Sept. 1, 1923, page 327; Youngstown & Suburban Railway, Jan. 27, 1923, page 181; Western Ohio Railway, Sept. 30, 1922, page 517; Chicago, North Shore & Milwaukee Railroad, Sept. 23, 1922, page 470, and June 9, 1923, page 959; Texas Interurban Railway, April 7, 1923, page 595; Bangor Railway & Electric Company, April 15, 1922, page 643.

Gaining Public Good Will in a City of 100,000*

Friendly Relations with Newspapers, Co-operation with City Authorities, Prompt Settlement of Claims, Courteous Trainmen, Clean and Freshly Painted Cars and Other Means Have Been Used Effectively in El Paso

POPULARIZING the street car service in El Paso, Tex., has largely been the result of gaining the good will of the public, of developing good relations between management and employee, and of conducting a very successful safety program.

The El Paso Electric Railway officials feel that it is difficult to say just how the public came to a realization of the fact that street railway transportation is of vital importance to it, and that it is even more difficult to attempt to set forth in anything like a brief statement the various methods which have been used to accomplish this end.

During the past year the company has used a very large amount of space in the daily papers telling the story to the public. That is one definite thing that has doubtless been of great help.

The company is a firm believer in the principle that the public is reasonable, and even generous, when it is fully acquainted with conditions, and has earnestly striven to interest it in the various phases of the company's business. The heads of departments are prominently identified with the local civic clubs, and several of them have been honored with the office of president. Through these clubs a very kindly feeling toward the company is built up, and newspaper articles on the business of the company frequently refer to the railway department as "Dixon's Railroad" (Alves Dixon is superintendent), or to "Warren's Company" (Alba H. Warren is manager). It is interesting to observe how quickly the public generally takes to this personal equation of the situation, and how quick patrons and customers are to speak to the individuals regarding the good points of the service. Whereas a few years ago complaints were numerous, both in the daily press and in the form of written and telephonic communications, the company is at the present time receiving at least twenty complimentary communications to one of an adverse nature.

GOOD SERVICE BUILDS GOOD WILL

This kind of public good will makes it possible to give better and better service, and the company states that its relations could hardly be improved upon. This is evidenced in so many ways that all of them could not be mentioned in an article of this kind. Several illustrations will prove of interest and are typical of the situation.

The citizens from a certain section of the city succeeded in eliminating jitney competition, despite the fact that the car fare is 6 cents, whereas the jitney fare was 5 cents. When a protest was made and the jitney men employed attorneys to fight the repealing ordinance

these citizens again went before the Council and their spokesman, a minister, made such a splendid plea for the company and against the jitneys that the ordinance eliminating the jitneys was permitted to stand.

There are three daily papers in El Paso, and two of them are not only friendly to the company, but seem even eager to assist it in every way possible, both from the standpoint of news items and by editorial comment, on the way the business is being run. The other paper, which is owned by the Scripps McRae syndicate, has not attacked the company.

On the contrary, its news columns have been unusually fair, and an editorial complimenting the company on the courtesy of its trainmen appeared in one of its recent issues.

There has been no newspaper opposition to anything the company has done during more than a year. This has been due largely to the fact that before inaugurating a change the management has gone to the newspaper men, has discussed the proposed change with them, has given the reasons and has asked their advice. In every instance this plan has been entirely successful.

The result has been that the company has not only been able to avoid criticism, but has, on the contrary, had the active co-operation and editorial backing of the newspapers.

GETTING BACKING OF MUNICIPAL AUTHORITIES

That the municipal authorities appreciate that the company is trying to render the best possible service, and that its efforts are directed solely in the interest of the upbuilding of the city of El Paso, has been accomplished by thoroughly acquainting the municipal authorities with the difficulties of operating a street railway system in these days of high costs. This has been done through a comprehensive education in the details and problems of operating, maintaining and financing, which has cost no little time and effort, but according to the company the results have been well worth while.

Among other things, for example, when streets outside of the business district are paved, it is a practically settled policy that the tracks of the company are to be left unpaved, even though it is stipulated in the franchise that the company must pave when the streets are paved. This has saved approximately \$200,000 during the past few years.

Appreciating the fact that some companies make the mistake of advertising and taking their story to the public only when in distress, the El Paso Electric Railway has, for the past year, been using regularly each week space in the local papers to convey information concerning some particular phase of the business. Sometimes these notices have described the workings of various departments, at other times they treat of some

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

particular problem of the company as a whole. Frequently causes of certain types of accidents are mentioned and these are what are called "timely," such as warnings against tangling kites in electric wires during kite season, etc.

ADVISING THE PUBLIC OF SCHEDULE CHANGES

Whenever it is found necessary or advisable to change car schedules, the public is first notified through the newspapers and then cards are placed in all of the cars on the line affected. It is made a point to emphasize that the change is being made for the improvement of service, and the public has been found very appreciative of this advice. A serious handicap in the operation of the cars is the fact that two transcontinental railway lines run through the heart of the city within half a block of each other, and long and heavy trains frequently occasion considerable delay to the street cars. These trains, on account of the heavy grade, frequently stall or pull out a drawhead, and the service is then delayed longer than usual. On several occasions when the railroad made no effort to remove the trains promptly, the street cars have been delayed almost half an hour. On these occasions the company has advertised the cause of the delay in the local papers. This has not only enlightened the public as to the cause of the delay, but has been decidedly helpful in stirring up the railroads to act more promptly under similar circumstances.

Sometimes the claim department is unable to locate witnesses at the addresses given to conductors, and occasionally an out-of-town address is given. In such circumstances a questionnaire is sent them, and upon its return the company's acknowledgment thanking them for their kindness in mailing it. This acknowledgment is signed by the manager.

GOOD PUBLIC RELATIONS ASSIST IN INCREASING CAR FARE

In 1916 a strike of the company's trainmen took place, which was won by the company. Owing to the fact that El Paso is, to a considerable extent, a union town, this left much hard feeling. That this feeling has been overcome was very definitely illustrated when, two years ago, the company went before the City Council with its request for an increase in car fare. Not a single protest was raised. On the contrary, heads of several of the local unions and the managing editor of the local union paper were present and stated to the Council that they were of the opinion that the company was entitled to this increase. There has not been one single request for a decrease in fare in El Paso since that time.

CUSTOMER OWNERSHIP

The company believes that customer ownership is one of the biggest factors in the building up of the utility's public relations. It makes each patron, who is a security holder, a booster, provided that the company is properly managed and that the security holder receives a compensatory return on his investment. El Paso is one of the cities of the West where growth has been rapid during the past ten years. This has resulted in a scarcity of local investment capital and high interest rates. For example, the mortgage interest rate on commercial property with a 50 to 60 per cent equity is 8 per cent, and the interest rate on residential property is, in a large number of cases, higher. The common stock of this company is paying

a 10 per cent annual dividend. With a par value of \$100, its present market price is \$126, making the annual return on this basis 7.9 per cent. The preferred stock is paying a 6 per cent annual dividend. With a par of \$100 and an existing market price of \$88, the annual return is 6.8 per cent. The 5 per cent first mortgage gold bonds of the company, due in 1942, are at present selling for \$93, or at the rate of 5.4 per cent per annum.

Under these conditions it is most difficult to sell the bonds, common and preferred stock of the company yielding less than 8 per cent return to the investor in competition with an 8 per cent local interest rate. Again, the city is frequently floating a community enterprise of one nature or another, which affords greater dividends than the company can pay on its stock. For instance, money is now being raised for a 5,000-spindle cotton mill, on the theory that it will pay a 15 to 50 per cent annual return on the capital stock.

Despite the conditions above set forth, and at a time when new money was more costly than it is at present, in 1920 and 1921, the company sold locally to 512 customers a total of \$268,800. The security issued was a 7 per cent five-year gold convertible note, and was sold at \$96 and accrued interest to yield 8 per cent.

CO-OPERATION WITH POLICE DEPARTMENT

When a new chief of police was appointed several months ago, he was found exceedingly progressive and earnestly desirous of operating his department at the maximum of efficiency. The company has been helpful in traffic matters, and has assisted him in installing an up-to-date system for keeping record of traffic accidents. These records include maps where accidents, fights, burglaries, etc., are shown by location, and by the use of colored-headed pins indicating the type of occurrence. The company also supplied him with a clock chart, whereon the time of day when various types of accidents occur is indicated.

The company operates a telephone dispatch system, and the police department has been given keys to all of the telephone boxes. In return, the police department has furnished the company with keys to its telephone boxes, so that the co-operation between the two departments has been very helpful to both.

COURTEOUS TRAINMEN IMPORTANT

While it has long been realized that courteous trainmen are a valuable asset, this fact has not been fully appreciated until recently in El Paso, when the company has benefited in most unexpected ways and from unexpected quarters on account of some courtesy extended some one by its men. Not long ago an elderly lady who had stopped in El Paso a few days en route to Seattle wrote a friend in New York that one of the outstanding impressions of her trip across the country was the exceptional and remarkable courtesy of El Paso trainmen.

Trainmen are taught that they must be far better than merely good operators, and that each man in the organization must do his part toward selling the company to the public. It is astonishing how the men have taken this up themselves, and how they have gone even further in matters of courtesy than the company could expect or require. In addition to the instructions which new men are given in this respect, each man receives a special lecture twice a month by his divisional inspector.

Good-looking and attractive equipment is a very large factor in securing public good will, and though in El Paso it would be possible easily to run the cars eighteen months without repainting, the schedule calls for a new paint job every year. The principal difference is that by yearly painting the cars are kept bright and attractive, whereas when they are permitted to go for a longer period they become dingy and unattractive.

The cars are kept scrupulously clean, and never are permitted to go out in service with dirty windows.

PUBLIC SERVICE DEPARTMENT

The company has recently established a Public Service Department which performs a number of functions and has proved one of the largest factors in securing the excellent relations which the company now enjoys with the public. This department handles the various odds and ends which other departments have had to handle incidental to their regular business. Its activities comprise, among other things, the following: Advertising, handling of complaints, analyzing and filing all complaints, safety talks in schools, talks within the organization, talks among contact employees, talks among civic clubs, cultivating friendship of newspaper men, promoting the use of "Better Service" slips, entertainment of employees, such as dances, picnics, etc., educational work among the employees, which promotes a greater use of correspondence school courses, use of motion picture and stereopticon machines in getting the company's story over to the public and employees, establishing and charge of a company library, promoting greater use of the Boston Office Library, files and permanent forms of old newspapers and collections of clippings of all news items pertaining to the company. In addition this department is also in charge of the company's publication, *Cactus Points*. A closer contact with the various departments may be kept by every member of the organization through reading *Cactus Points*, and it is establishing a feeling of good fellowship which was never enjoyed prior to its publication.

In the handling of complaints this department is particularly valuable. A written complaint is immediately acknowledged, and if of any importance, by special delivery. The acknowledgment states that while the company regrets the necessity of the complaint, it is grateful to the writer for having taken the trouble to make it, and assures him that it will receive prompt and thorough attention. After the circumstances surrounding the complaint have been ascertained, the head of this department calls in person on the complainant and is almost invariably able to straighten it out to the entire satisfaction of all concerned. By the company's process of elimination, most of the causes of complaint can be disposed of, with the result that complaints become fewer and fewer in number. As an illustration of this, two years ago through the inspector of public utilities an average of twenty complaints a month was received. During the past year these complaints fell off to less than two a month, and quite recently the office of the inspector of public utilities was abolished, largely for the reason that complaints of street car service, which had formed a large part of its business, had been practically eliminated.

OTHER MEANS OF IMPROVING PUBLIC RELATIONS

An ordinance exists in El Paso prohibiting vehicles from passing street cars which are receiving or discharging passengers. Many automobilists are either

unacquainted with or willfully violate this ordinance, and in order to help remedy the situation the word "Stop" has been painted on one of the folding doors. Some of these signs are painted on the wooden part of the door, and others on the glass. The ones on the glass are, perhaps, more easily seen at night, but both of them have aided very much in having automobilists bring their cars to a stop while the street cars are loading or unloading passengers.

Upon the company's initiative, without any suggestions from outside sources, its poles have been removed from the business districts, and, instead, span wires are fastened to adjacent buildings, greatly improving the looks of the streets.

In its advertisements and other ways the company, to a far-reaching extent, has sold to the public the idea that it is a local concern. All the company's trucks and automobiles carry the company name, and it is now planned to erect an office building to help maintain the "Home Company" idea. The company's name is displayed on the power plant, office building, etc. Following out this idea, the company has originated a letterhead which has been adopted by all Stone & Webster properties in the Texas district. This letterhead carries the names of the executives and departmental heads and their positions. This idea has lately been carried into the company's general advertising, the names of departmental heads being carried in advertisements affecting their department.

A further effort to localize the company is the practice of training the men for promotion. When a vacancy occurs anywhere in the organization, every effort is made to fill it from within the company's own ranks, and to go outside the organization only as a last resort.

It is planned to issue to the company's patrons on the first of the coming year a book giving the details of the activities of the company during the year just closed. This book will contain such information as it is felt the customer would like to know, and what the company would like to have him know about itself. Of late, the company has emphasized the three partners, i.e., customer, company and employee. Their wants must be fully satisfied before the company is willing to admit that its operation is, in every sense, successful.

Every year a report is issued to the stockholders, detailing such information therein as is believed will be of pertinent value. Through the medium of the company publication and various other means, employees are constantly advised of the company's activities. In other words, the company's activities are got over to the employees and the stockholders in a pretty definite and concrete way. The thought is that this should be done also for the patrons of the service.

This booklet will start out with a statement about the utility's aims and ambitions in the matter of serving its patrons; it will attempt to show the difference between operating a public utility and other businesses from a financial standpoint, with particular emphasis on the fact that the company turns its capital over only once every three or four years at best, and stressing the large amount of annual capital requirements.

Following this will be detailed the amount of money expended for construction during the year, stating precisely what the money was used for, why it was needed and the improvement that resulted because of the expenditure. What has been done to improve all personal contact relations with the patrons will be

shown. Definite things that have been done to assist in the further growth of the prosperity of El Paso will be mentioned. Figures and statistics will also be presented showing the growth of the company, special consideration being given to kilowatt-hour output, car-miles run, analysis of accident situation, and other pertinent statistics of similar nature. Figures will be given as to the capacity and nature of equipment in the power plant, number of street cars owned, miles of track, etc. The company's income and detailed expenses will be shown. A copy of the balance sheet will be included.

Photographs of the officials and executives of the company will be shown, possibly with group photographs of the various departments, with a little story as to the part each plays in rendering service. It will also contain a statement showing the small proportion of a man's annual income that is spent for utility service, and other things tending to illustrate and prove the cheapness of electric service.

The company's final thought is that this booklet will portray to the patrons, a splendid idea of the company's activities and is calculated to improve and build up public confidence in and an appreciation of the problems of a street railway company.

Railway Finds New Source of Revenue

Steel Dump Cars Increase the Income of the Wheeling Traction Company by Hauling Mine and Power Waste on Contract Basis

THE Wheeling Traction Company does not rely for revenue only on its passenger transportation business or interurban express service. The railway has availed itself of an opportunity that was presented to solve the problems of two brother utilities—a power plant and a coal mine—and at the same time improve its own finances. After the completion of the 150,000-kw. power plant of the Beech Bottom Power Company at Windsor, W. Va., some means of disposing of the ashes from the boilers had to be found. A hopper car stationed on a siding into which the daily refuse would go was out of the question because the plant was not situated adjacent to a steam railroad. The traction company's right-of-way, however, passes close by the power plant and a spur siding made it possible to bring its cars very conveniently to a loading hopper.

For the railway the proposition meant a considerable expenditure for equipment to handle the work. Steel dump cars were recommended as the best for this purpose, and arrangements were made for the disposition of 490 tons of cinders daily.

Three Differential dump cars constituted the initial equipment. It was planned to use two motor cars and a trailer in train operation. Each one of the three cars equipped with additional side boards has a capacity of 18 tons. The motor cars are propelled by quadruple equipments of Westinghouse 532-A motors, each motor having a 50 hp. capacity. Electro-pneumatic HL control is provided for double-end control and arranged for multiple-unit operation, as is required when the three dump cars are used together. The dumping mechanism is operated by a Westinghouse type "HK" 5-hp. motor and a type 810 switch and control panel.

Three-Car Train of the Wheeling Traction Company, Consisting of Two Motor Dump Cars and One Trailer

Another matter of importance was a suitable and convenient location where the ashes could be disposed of. The owner of a ravine at Glenn's Run, Warwood, consented to have the ashes used for filling the ravine, the depth of which averaged 35 ft. The fill extends over an area of about 15 acres. From the cinder pit at the power plant to the dump the distance is about 5½ miles.

Another opportunity for additional revenue was

Loading Ashes at the Power House Hoppers

grasped by the railway management a short time after it had begun serving the power company. At a mine belonging to the Richland Coal Company the point had been reached where some disposition of the "gob" must take place immediately. The traction company again offered a proposition similar to that accepted by the power company. Tracks were laid, another dump car purchased and today the daily refuse of from 150 to 200 tons is being handled with mutual satisfaction. The mine "gob" is hauled about 2.2 miles to the dump.

Filling in a Deep Ravine with the Ashes

Automatic Feeder Control Prevents Service Interruptions

A Combination of Automatic Substation and Special Automatic Feeder Operation with Supervisory Control Insures Continuity of Service on Cleveland Railway Lines—Short Circuit Is Burned Off, Without Shutting Down the Section, by Connecting Several Feeders to the Shorted Line Through Resistance

By Maurice E. Reagan

Switchboard Engineer Westinghouse Electric & Manufacturing Company

A PLAN has been devised and applied on the system of the Cleveland Railway whereby the individual feeders are automatically controlled, but the load dispatcher is given a chance to transfer the circuits in case of a short circuit in such a manner that the short may be burned off without taking an entire feeder section out of circuit. This has been accomplished by the use of a number of new devices worked out to meet the peculiar conditions prevailing on the metropolitan city system and applied first on the Cleveland Railway system.

In order to understand fully what has been accomplished in this installation, the distinctions between automatic substation control of the ordinary type and this Cleveland installation will be sketched briefly.

EARLY AUTOMATIC CONTROL UNSUITABLE

In the earliest form of automatic feeder control, both for light and heavy traction service, large-capacity iron resistance units were inserted in a feeder circuit upon occasion of overload on that section. The overloaded feeder would thus operate on reduced voltage and

from at least one of its ends during the period, while remaining sections feeding from the same station would be undisturbed. Satisfactory results were obtained by the foregoing method when the effective resistance of the circuit consisting of feeder cable, trolley, and rail return to the nearest adjacent "feed-in" point was comparatively high, as is the case in light traffic centers.

In heavily loaded districts encountered in city service the relative resistance of feed-lines is low. Also, the majority of urban feeders are connected to more than one station. The insertion of a resistance in the feeder circuit lowers the voltage, and shunts a portion of the load to other adjacent stations feeding the same section. Of course, the right value of resistance must be used, or too great a share of the load may be transferred to the other station, resulting in the automatic insertion of resistance at that point. If enough load is dropped from the near-by station, the breaker at the near end recloses, and surging back and forth is inevitable. Furthermore, if the overload persists long enough to

disconnected from the bus until the resistance cools. In the meantime, the cars supplied by this feeder are without power. Also, during the period of greatest load lower voltage is supplied to the cars, causing lower speeds and greater congestion.

The above principle of operation was, therefore, found entirely unsuited for heavy traffic conditions where two or more substations were automatically operated in parallel. Since the machines in the substations had sufficient capacity for any legitimate load, only trouble on the feeder system should disturb the flow of energy. The machines being protected from overheating, it should be necessary to disconnect a feeder from the bus only in case of a short circuit on it.

AUTOMATIC RELAY DETECTS SHORT CIRCUITS

To take care of this condition, a device known as the "short-circuit detector" was developed, by means of which the feeder breaker would remain closed through all periods of overload. Only a short circuit would cause it to open. This relay consisted of a sensitive moving element whose operating coil was connected across the secondary of a current transformer. The primary of the current transformer was the main outgoing feeder cable. The iron circuit of the current transformer had a small air gap to prevent saturation from the normal direct-current load and give a straight saturation curve. Then a short circuit of a certain resistance would induce a definite current in the secondary of the transformer regardless of the direct-current load being carried at the time the ground occurred.

The time required for the current to reach its maximum value on closing a circuit depends on the inductance of the various portions of that circuit. Thus with the sudden application of an inductive load, such as street car motors, the current will build up so slowly as to induce very little energy in the secondary of the current transformer. Since a short circuit has little inductance, the rise of current presents a very steep wave front, transferring a large amount of induced energy to the transformer secondary and hence to the relay coil. The current induced in the secondary of the transformer is then a direct measure of the value of the short circuit. If the current flowing exceeds a certain amount it is desirable to disconnect the feeder from the main station bus. The relay acts accordingly, and the feeder breaker opens.

Shortly after the feeder breaker opens, a circuit operating on the Wheatstone bridge principle is set up to measure the resistance of the feeder circuit, the object being to indicate when it is safe to reconnect the feeder to the main station bus. As the ground is removed the resistance suddenly rises and the reclosing relay sets up the circuit for reclosing the contactor. This scheme of operation keeps the section dead until some one picks up the broken trolley or in some other way removes the low resistance path.

PRECAUTIONS TO PREVENT SERVICE INTERRUPTIONS

On systems such as the Cleveland Railway every precaution is taken to prevent the slightest interruption. Provision had therefore to be made to keep power on the section of line affected by the short circuit, if possible.

Each substation has two direct-current buses. The main bus normally is connected to the positive terminals of the converters when they are in operation, while the second or auxiliary bus is connected to the main bus

through a high capacity resistance by means of a contactor. Each outgoing feeder has a double contactor arrangement so that it may be connected to either the main or the auxiliary bus. The two contactors are so interlocked, however, that only one of them may be closed at one time.

The feeder contactor connecting to the main bus may be opened in two different ways. The first is automatic, through action of the "short-circuit detector" upon occasion of a ground. The second is by means of the "supervisory control system" at the will of the load dispatcher. This man, located in a downtown office, has before him an operating board displaying two lamps corresponding to each contactor and each main piece of apparatus in the substation. One lamp is red, the other white. The red lamp shows that the particular part of the equipment to which it corresponds is in the closed or energized position. If the position of any portion of the equipment in any substation changes, the dispatcher gets an immediate indication by means of the change in lamp signals. The system of remote control provided enables the dispatcher to transfer any feeder from the main to the auxiliary bus, retransfer it back to the main bus, or lock it out of service entirely by opening both contactors.

AUXILIARY BUS USED TO INSERT RESISTANCE WHEN A GROUND OCCURS

In normal operation all feeders are connected to the main bus, with the bus-tie resistance connected ready for operation. Should a ground occur, the feeder on which it occurs is at once automatically transferred to the auxiliary bus. The feeding is then from the main bus through the bus-tie resistance to the auxiliary bus and thence into the short-circuit. The load dispatcher is at once informed by the corresponding change in lamp signals that the feeder has been transferred. He also gets an approximate indication of the voltage on the auxiliary bus, which gives him some idea of the resistance of the fault. Following out the object of this special arrangement, which is to clear the trouble as quickly as possible, he transfers other feeders in the station from the main to the auxiliary buses in order to raise the voltage. This causes a larger flow of current into the faulty section and the ground is soon burned clear.

When the fault is removed, all feeders must automatically retransfer to the main bus. To ascertain if the line is clear, the resistance of the circuit in trouble is being measured while the feed is taken through the auxiliary bus. The usual resistance-measuring relay which operates on the Wheatstone bridge principle is not applicable in this system, since the voltage of the auxiliary bus may have any value up to 600. A relay is required which will measure a resistance from a variable voltage source. This has been taken care of by a type of resistance-measuring relay which has two operating coils pivoted on a common balance arm. One of the coils is connected with a variable resistance in series between the auxiliary bus and ground; the other coil is connected across a shunt in the outgoing feeder circuit. Hence, one coil measures the voltage of the auxiliary bus, while the other determines the flow of current into the fault. At a point slightly below that set for reclosing, the two coils are calibrated to have the same pulling effect, so that a balance is reached.

When a feeder has been grounded and has been transferred to the auxiliary bus, this relay is placed in the

circuit automatically, with the current coil overbalancing the voltage coil. If the resistance of the short-circuited feeder remains constant while the voltage of the auxiliary bus rises, the pull of the voltage coil increases. However, this is accompanied by a corresponding increase in the pull of the current coil. Thus the relay gives an accurate measure of the resistance, regardless of the value of voltage on the auxiliary bus. As the resistance rises to a value at which it is permissible to reclose the feeder to the main bus without again operating the "short-circuit detector," the relay acts, making a contact to retransfer the feeder.

The coil of the "short-circuit detector" relay which is connected across the secondary of the transformer has several taps brought out so that the relay may be calibrated by changing one screw on the terminal board. Each feeder on the system has an individual setting depending on its resistance to the nearest adjacent feeder station. Having determined the corresponding short-circuit current, 80 per cent of this value is taken as the value at which the "short-circuit detector" should operate.

Referring to the diagram of connections given, this means that a short circuit occurring on the right hand side of point *X* would transfer the station *B* feeder to the auxiliary bus but would not affect station *A*. On the other hand, a short occurring to the left of point *Y* would cause a transfer of the connections at station *A* but would not affect station *B*. However, should trouble take place between *X* and *Y*, both stations would be transferred. The reason for this arrangement is that this same feeder may be used to carry current to burn off a ground on some other feeder leading out of the far station. It would be undesirable to transfer it to the auxiliary bus at the near end if connected to the auxiliary bus at the far end by the load dispatcher. The proper calculation is made on each individual feeder circuit, and a relay setting is made to correspond. In case a radical change is made in the feeder circuits a new relay setting is required.

OPERATION OF RECLOSING RELAY

After the tripping value of the feeder has been determined by the foregoing method, the reclosing relay is set at a point approximately 25 per cent below this amount. As stated before, this adjustment is accomplished by the variation of a resistance in series with the voltage coil of the resistance-measuring relay. Suppose, for example, a feeder is set to transfer on a short circuit of approximately 2,000 amp., and it is desired to retransfer the feeder to the main converter bus when the resistance of the feeder is such that 1,500 amp. will flow when connected to a 600-volt circuit. Since the current coil is connected to a 2,000 amp. shunt, there will be approximately 37.5 millivolts on the current coil at the point of retransferring. Approximately 40 millivolts are required on the voltage coil to overbalance and make contact. By referring to the curve, the necessary amount of resistance to have in series with the voltage coil is determined to correspond with 40 millivolts and set the rheostat accordingly.

The feeder usually transfers from the main to the auxiliary bus only upon occasion of a short circuit. At such a time precautions must be taken to keep the converter from dangerous flashing. As the heavy load is thrown onto the converter, the armature is pulled back from the synchronous position an amount depending on the resistance of the ground. If the load is suddenly

removed by opening the feeder breaker, the armature jumps quickly ahead to a position as determined by the remaining legitimate load. All of the armature energy corresponding to the difference in phase position is given up. If this amount of energy is great enough, the converter will flash.

Developments at the present time to prevent flashing include high-speed breakers, having enough feeder resistance between the machine and the first connection to the trolley or by the insertion of sufficient resistance in the machine circuit to limit the current to a value within the commutating capacity of the converter before opening the circuit. The use of the high-speed breaker, which opens the circuit before the armature can be pulled a dangerous amount away from the synchronous position, entails features such as opening under a slight reduction of voltage, etc., which renders it undesirable for such application. Having a permanent resistance of

Short-Circuit Detector Relay and Auxiliary Relay,
Nos. 5 and 6 in Fig. 1

sufficient value in the feeder is also undesirable because of the constant loss, the drop in voltage under heavy loads, and the extra copper required to feed the territory nearest to the station.

The system now in use in Cleveland temporarily inserts resistance in the machine circuit for several cycles before the feeder breaker opens. This allows time for the armature to settle in a position from which all load may be suddenly relieved without causing damage. To accomplish this, an air-gap current transformer with a "short-circuit detector" is placed in each machine circuit as well as each feeder circuit. The impulse from the steep wave-front current curve starts both the machine and feeder "short-circuit detectors" operating at the same instant. The time differential comes from the difference in timing between the two contactors. As soon as the feeder breaker opens, disconnecting the feeder from the main bus, the resistance is removed from the machine circuit.

The majority of contactors used in railway feeder application have been of the magnetic type. The natural limitation of this type of contactor is that it will not close on less than 60 per cent of normal voltage. However, since a feeder should be operative when the station is out of service so that other stations may feed through to sections out of their normal zone, the energy for closing the feeders must come from some separate and reliable source. Pneumatic contactors similar to those in use for years in railway car and locomotive service have been adopted in Cleveland. The energy to operate the air valves is supplied by a storage battery.

Some Depreciation!

James Ashton Greig, Chicago, Ill.

EDUCATION

Edward Dana, general manager Boston Elevated Railway, Boston, Mass., chairman.
Edward J. Blair, Chicago, Ill.
C. F. Crane, Harrisburg, Pa.
C. B. Fairchild, Philadelphia, Pa.
R. M. Howard, Winona, Minn.
Myles B. Lambert, East Pittsburgh.
M. McCants, San Francisco, Cal.
James McFall, Pittsburgh, Pa.
C. E. Morgan, Brooklyn, N. Y.
H. H. Norris, New York, N. Y.
J. V. Sullivan, Chicago, Ill.

MAIL PAY

L. H. Palmer, general manager United Railways & Electric Company, Baltimore, Md., chairman.
Gordon Campbell, York, Pa.
G. K. Jeffries, Indianapolis, Ind.
R. A. Leusser, Omaha, Neb.
Samuel Riddle, Louisville, Ky.
W. S. Rodger, Highland Park, Mich.
H. B. Weatherwax, Albany, N. Y.

COMMITTEE TO CO-OPERATE WITH THE NATIONAL SAFETY COUNCIL

J. P. Barnes, president Louisville Railway, Louisville, Ky., chairman.
H. O. Allison, New Brighton, Pa.
Charles W. Chase, Gary, Ind.

UNIFORM REGULATORY LAWS

A. W. Brady, president, Union Traction Company of Indiana, Anderson, Ind., chairman.
Wm. Chamberlain, Cedar Rapids, Iowa.
E. J. Dickson, Providence, R. I.
George E. Hamilton, Washington, D. C.
R. D. Hood, Haverhill, Mass.
T. W. Passailaigue, Charleston, S. C.
Alfred Sweeney, Lewiston, Me.

C. L. S. Tingley, Philadelphia, Pa.
H. B. Weatherwax, Albany, N. Y.

GENERAL ARRANGEMENTS MIDYEAR DINNER

W. H. Sawyer, president East St. Louis & Suburban Railway, East St. Louis, Ill., chairman.

E. B. Meissner, St. Louis, Mo., vice-chairman.

James P. Barnes, Louisville, Ky.
F. G. Buffe, Kansas City, Mo.
Edward Dana, Boston, Mass.
C. R. Ellicott, New York, N. Y.
H. B. Flowers, New Orleans, La.
L. E. Gould, Chicago, Ill.
J. H. Hanna, Washington, D. C.
H. J. Kenfield, Chicago, Ill.
M. B. Lambert, East Pittsburgh, Pa.
R. V. Prather, Springfield, Ill.
Harry Reid, Indianapolis, Ind.
E. P. Waller, Schenectady, N. Y.

NATIONAL RELATIONS

Charles L. Henry, president Indianapolis & Cincinnati Traction Company, Indianapolis, Ind., chairman.

W. A. Baehr, Chicago, Ill.
H. G. Bradlee, Boston, Mass.
Ralph R. Bradley, Chicago, Ill.
Arthur W. Brady, Anderson, Ind.
C. D. Cass, Waterloo, Iowa.

INDETERMINATE FRANCHISE

Edwin Gruhl, vice-president and general manager, North American Company, New York, N. Y., chairman.

Walter A. Draper, Cincinnati, Ohio.
Edwin Duffey, Cortland, N. Y.
H. L. Geisse, Wausau, Wis.
F. C. Hamilton, New York, N. Y.
R. B. Stearns, Boston, Mass.

INSURANCE

John T. Staub, treasurer United Railways & Electric Company, Baltimore, Md., chairman.

O. H. Bernd, Des Moines, Iowa.
Granville H. Bourne, New York, N. Y.

N. H. Daniels, Boston, Mass.
B. J. Denman, Davenport, Iowa.
Charles E. Fahrney, Ottumwa, Iowa.
F. M. Hamilton, Chicago, Ill.
A. D. Knox, New Haven, Conn.
John H. Moran, Boston, Mass.
C. E. Morgan, Brooklyn, N. Y.
Charles B. Scott, Chicago, Ill.
Paul E. Wilson, Cleveland, Ohio.

RELATIONSHIP WITH THE MOTOR VEHICLE INDUSTRY

L. S. Storrs, president, The Connecticut Company, New Haven, Conn., chairman.

J. G. Barry, Schenectady, N. Y.
A. W. Brady, Anderson, Ind.
F. R. Coates, Toledo, Ohio.
C. D. Emmons, Baltimore, Md.
R. P. Stevens, New York, N. Y.

RAPID TRANSIT

Wm. S. Menden, president Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., chairman.

B. J. Fallon, Chicago, Ill.
R. F. Kelker, Jr., Chicago, Ill.
L. H. Palmer, Baltimore, Md.
F. R. Phillips, Pittsburgh, Pa.

SPECIAL TAXES

W. H. Maltbie, special counsel United Railways & Electric Company, Baltimore, Md., chairman.

F. C. Chambers, Des Moines, Iowa.
A. T. Davison, New York, N. Y.
Edwin Gruhl, New York, N. Y.
A. G. Neal, Washington, D. C.
H. B. Sawyer, Boston, Mass.

VALUATION

F. W. Doolittle, vice-president The North American Company, New York, N. Y., chairman.

F. C. Hamilton, New York, N. Y., vice-chairman.

J. P. Barnes, Louisville, Ky.
E. J. Bechtel, New York, N. Y.
H. M. Brinckerhoff, New York, N. Y.
H. A. Clark, New York, N. Y.
Thomas Conway, Jr., Philadelphia.
W. Findlay Downs, Philadelphia, Pa.
J. A. Emery, New York, N. Y.
C. W. Gillespie, New York, N. Y.
J. B. Klumpp, Philadelphia, Pa.
W. H. Maltbie, Baltimore, Md.
L. R. Nash, Boston, Mass.
A. S. Richey, Worcester, Mass.
W. H. Sawyer, East St. Louis, Ill.
Frank Silliman, Jr., New York, N. Y.
W. B. Tuttle, San Antonio, Tex.
E. D. Uhlendorf, Chicago, Ill.

CHARLES A. COFFIN FOUNDATION AWARD

Britton I. Budd, president Chicago Elevated Railroads, Chicago, Ill., and president American Electric Railway Association, chairman.

J. N. Shannahan, Hampton, Va.
James H. McGraw, New York, N. Y.

COMMITTEE ON UNIFICATION AND CO- ORDINATION OF ALL FORMS OF LOCAL TRANSPORTATION

G. A. Richardson, vice-president Chicago Surface Lines, Chicago, Ill., chairman.

H. C. Abell, New York, N. Y.
C. P. Billings, Pittsburgh, Pa.
F. R. Coates, New York, N. Y.
C. D. Emmons, Baltimore, Md.
W. F. Ham, Washington, D. C.
A. D. Mackie, Springfield, Ill.
A. T. Perkins, St. Louis, Mo.
L. S. Storrs, New Haven, Conn.

REPRESENTATIVES OF THE ASSOCIATION ON OTHER NATIONAL ORGANIZATIONS

National Transportation Institute:
J. H. Hanna, vice-president The Capital Traction Company, Washington, D. C.

Committee on Customer Ownership of the National Electric Light Association:

R. P. Stevens, president Republic Railway & Light Company, New York, N. Y.

National Councillor of the United States Chamber of Commerce:

J. N. Shannahan, president Newport News & Hampton Railway, Gas & Electric Company, Hampton, Va.

Substitute National Councillor:

J. H. Hanna, vice-president Capital Traction Company, Washington, D. C.

National Industrial Conference Board:

L. S. Storrs, president The Connecticut Company, New Haven, Conn.

J. H. Pardee, president The J. G. White Management Corporation, New York, N. Y.

American Committee on Electrolysis:

W. J. Harvie, vice-president Auburn & Syracuse Electric Railway, Auburn, N. Y.

National Committee for National Defense:

Edward J. Blair, assistant to the president, Chicago Elevated Railroads, Chicago, Ill.

National Joint Committee of Public Utility Associations:

Randall Morgan, vice-president United Gas Improvement Company, Philadelphia, Pa., chairman.

Britton I. Budd, Chicago, Ill.

J. K. Choate, New York, N. Y.

F. R. Coates, New York, N. Y.

E. C. Faber, New York, N. Y.

P. H. Gadsden, Philadelphia, Pa.

L. S. Storrs, New Haven, Conn.

Robert I. Todd, Indianapolis, Ind.

J. W. Welsh, New York, N. Y.

Accountants' Association

STANDARD CLASSIFICATION OF ACCOUNTS

Robert N. Wallis, treasurer Fitchburg & Leominster Street Railway, Fitchburg, Mass., chairman.

M. W. Glover, Pittsburgh, Pa.

W. F. Ham, Washington, D. C.

H. L. Wilson, Boston, Mass.

Percy S. Young, Newark, N. J.

COMMITTEE REPRESENTING THE AC- COUNTANTS' ASSOCIATION AT CON- VENTION OF RAILWAY AND UTILITIES COMMISSIONERS

Wallace L. Davis, auditor Lehigh Valley Transit Company, Allentown, Pa., chairman.

B. W. Fernald, Oakland, Cal.

C. S. Mitchell, Pittsburgh, Pa.

RELATIONS WITH OTHER ASSOCIATIONS

M. W. Glover, general auditor West Penn Railways, Pittsburgh, Pa., chairman.

I. A. May, New Haven, Conn.

Mail Pay Hearing

TESTIMONY was taken last week in the railway mail pay case before Examiner Mullen of the Interstate Commerce Commission, I. C. C. Docket No. 10227, consuming four full days, Nov. 19 to 22. Joseph Stewart, special assistant to the Attorney General was in charge of the commission for the Post Office Department, and W. H. Maltbie, counsel for the committee on mail pay, American Electric Railway Association was in charge of the case for the railways.

C. W. Cornell of counsel for the Pacific Electric Railway Company, and F. E. Loucks, a special accountant for that company were in attendance and presented some evidence for their road. The witnesses put on by the mail pay committee were Prof. A. S. Richey, Worcester, Mass., Dr. Thomas Conway, Jr., Philadelphia, and Joseph A. Stoll, superintendent traffic, A. T. Clark, superintendent rolling stock and shops, and John B. Duvall, assistant superintendent of transportation of the United Railways and Electric Company of Baltimore.

After finishing the four-day session during which some fifty exhibits had been filed, the examiner set March 1 as the final date for filing of briefs. After the briefs have been filed, the commission, it is expected, will set a date for oral argument and will thereafter take the case under advisement for a decision.

Companies Which Made Presentations for Coffin Prize

LETTERS of acknowledgment and commendation are being sent by the Executive Committee to the railway companies which made presentations to the Charles A. Coffin prize committee of the American Electric Railway Association, in accord with the resolution passed at the meeting of the executive committee on Nov. 16. The companies which submitted briefs follow in alphabetical order:

Chicago, North Shore & Milwaukee Railroad, Highwood, Ill.
Colorado Springs & Interurban Railway, Colorado Springs, Col.
East St. Louis & Suburban Railway and East St. Louis Railway, East St. Louis, Ill.

El Paso Electric Railway, El Paso, Tex.
Holyoke Street Railway, Holyoke, Mass.
Interstate Public Service Company, Indianapolis, Ind.
Kansas City Railways, Kansas City, Mo.
Kentucky Traction & Terminal Company, Lexington, Ky.
Los Angeles Railway, Los Angeles, Cal.
Milwaukee Electric Railway & Light Company, Milwaukee, Wis.
Monongahela-West Penn Public Service Company, Fairmont, W. Va.
Northern Texas Traction Company, Fort Worth, Tex.
San Diego Electric Railway, San Diego, Cal.
San Francisco-Oakland Terminal Railways, Oakland, Cal.
Spokane United Railways, Spokane, Wash.
Union Street Railway, New Bedford, Mass.
Washington Railway & Electric Company, Washington, D. C.

News of Other Associations

Program Announced for New England Club Meeting

THE December meeting of the New England Street Railway Club will be held at the Copley Plaza Hotel, Boston, Mass., on Thursday, Dec. 6. The afternoon meeting, called to order at 3 o'clock, will be devoted to a series of fifteen-minute papers on the following subjects: "Snow Handling Equipment" (with moving pictures), by Charles F. Reuter, engineer Eastern Tractors Company; "Results Obtained in Track Work by the Use of Mechanical Devices," by F. B. Walker, engineer Eastern Massachusetts Street Railway; "Electric Freight Haulage," by P. H. Stoffel, Westinghouse Electric & Manufacturing Company.

The evening meeting will be devoted to a talk, illustrated by slide and moving pictures on "Maine, the Sportsman's Paradise," by Eugene S. Jones, photographer of the Boston & Maine Railroad. A dinner will be served at 6.15.

C.E.R.A. Annual Meeting in Indianapolis Jan. 24 and 25

THE Annual Meeting of the Central Electric Railway Association will be held at Hotel Lincoln, Indianapolis, Ind., Thursday and Friday, Jan. 24 and 25, 1924. There will be a dinner on the evening of Jan. 24.

Relief from Paving Burden Urged

THERE is no longer any good reason why a railway should pay for installation of original pavements or for complete repavements, declared R. C. Cram in a paper read before the

National Municipal Research Council held at the City Club, Washington, D. C., on Nov. 16. This is so because the presence of tracks has nothing to do with the question of the need for street pavements. The only requirement as to railway pavements may be one relating to the extent the railways, through operation of cars, may cause deterioration in the pavement, and this should be limited strictly to repairs needed in consequence of the existence and use of the tracks.

Some interesting data were presented by Mr. Cram tending to show that paving maintenance costs are substantially the same as on any part of a railway street. These data seem to support the view that railway streets, being main arteries of travel, receive greater traffic. It should logically be expected that main traveled streets will require more extensive paving repairs than streets of lesser importance.

Dean Cooley Honored

UNIVERSITY presidents, judges, engineers and men prominent in political life, gathered at a dinner in Detroit on November 23, paid tribute to Mortimer E. Cooley, dean of the engineering schools of the University of Michigan and retiring president of the Federated American Engineering Societies. Dean Cooley, at the end of nearly half a century of effort, was extolled as an engineer and educator of distinguished public service.

The dinner was given under the auspices of the Detroit Engineering Society and the local section of the national engineering societies.

Those at the speakers' table included Supreme Court Justice Robert F. Thompson, Canandaigua, N. Y.; Ira N. Hollis, president of Worcester Polytechnic Institute and classmate of Dean Cooley at the United States Naval Academy; Admiral John K. Robinson, representing Secretary of the Navy Edwin Denby; Dr. Marion L. Burton, president of the University of Michigan; Philip N. Moore, St. Louis, vice-president of the Federated American Engineering Societies; F. Paul Anderson, dean of engineering of the University of Kentucky; Chase S. Osborn, L. W. Wallace, executive secretary of the Federated American Engineering Societies, Washington; Truman H. Newberry, Walter S. Russel, Charles F. Loweth, president of the American Society of Civil Engineers; N. S. Shaw, president of Michigan Agricultural College; and John L. Herrington, president of the American Society of Mechanical Engineers.

Several speakers brought out reminiscences of Dean Cooley's days at Annapolis and later as a naval officer. Others dwelt upon his services to education and to engineering, praising "his high character, his big-heartedness and geniality, his noble aspirations and his love for his fellowmen." President Burton paid a tribute to the work of Dean Cooley in his long connection with the University of Michigan.

Dean Cooley has been granted leave of absence for the second semester of the present academic year by the University of Michigan. He will spend this period on a farm recently purchased by him near Canandaigua, N. Y. His successor as president of the F. A. E. S. will be elected at the annual meeting of the American Engineering Council early in January.

Kentucky Utilities Association to Meet at Louisville

THE annual meeting of the Kentucky Association of Public Utilities will be held at Louisville on Dec. 13 and 14. The session will open with a dinner for the delegates on Thursday evening, with the technical sessions on Friday.

Aims and Plan of the National Transportation Institute

THE National Transportation Institute is a comparatively new national organization, whose object is to change the attitude of the public at large toward transportation in general. It comprises all industry and is governed by a board of directors made up by groups, such as agricultural, railway, public utility, etc., consisting of fifty-two directors of whom twenty-six have been elected at this time. It is a continuing board with certain expirations each year, so that the chance for control by any group is thought to be remote. Membership in the institute may be had by practically any company or organization at \$100 per membership, and any organization may take out as many memberships as it desires, having one vote for each membership.

The institute consists of a research council and a publicity bureau. The research council will comprise a group of men particularly fitted by experience to develop the facts about the various transportation agencies—steam railroads, electric railroads, motor buses, water transportation, etc. The members of the council are to be selected by the process of the president nominating three men, from among whom the directors will elect one. This again is designed to avoid any possible control of the organization by one group.

The representatives of the institute have conceived the need for this organization because there is at present no comprehensive study of transportation going on by a disinterested impartial body. The absence of this has afforded opportunity for radical elements to attack the railways and make extensive use of false information. The key to the institute plan is the research council, which is to be composed of men of accepted reputation who will be given a certain amount of money and set aside where they will be free from responsibility to any organization or group. They will get the facts and then these facts will be put out to the public through the publicity bureau.

It is expected that the most effective work of the institute will come later when it has sufficiently progressed in its organization and finances to permit of the employment of men to give their entire time to speaking on transportation problems. The idea is that there may ultimately be the equivalent of one speaker for every state. It is

thought also that addresses of this kind will produce much publicity in the newspapers. Further, the newspapers, knowing that they can apply to the Institute for information upon which they can depend as accurate and impartial, will have no reason to publish misinformation.

Another phase of the work is educational in nature. It is claimed that the proportion of children who never go so far in their schooling as high school is so great that as they grow up they numerically control the popular vote. This great body of children at present receives practically nothing in the way of information as to the influence of transportation, coal, or any of the other essentials on their lives. The Institute plans to bring to the school children the effect of various businesses on the child's life.

The institute is now publishing a twelve-page leaflet monthly, but plans ultimately to have a magazine of considerable importance as a medium for putting out the results of its efforts. It is planned also to use motion picture lectures, in which it can bring out what transportation, or the lack of it, means to a country.

The Institute has no relation with the United States Chamber of Commerce or any other body. It is an independent body in which it is considered essential that all business interests participate. On the question of municipal or government ownership, the policy of the institute is not stated, as the idea of creating the institute as an entirely impartial body precluded any predetermination of policy on any matter. If the reports of the research council were not unanimously concurred in by the council, there is nothing in the present organization of the body to prevent both the majority and minority reports being made public, although it would obviously be the endeavor to reach unanimous agreement.

This is the first time that all business interests have joined together in a movement of this kind. The institute earnestly desires that the electric railways support and take part in its activities. The American Electric Railway Association has not as yet determined what its action shall be with respect to endorsement of the Institute, but has the matter under advisement at the present time.

Maintenance of Equipment

Signal System Shows Steam Pressure

THE Wilmington, N. C., power plant of the Tidewater Power Company has a signal system in the generator and boiler rooms which shows the steam pressure carried in the main header. The scheme was developed by George Avant, combustion engineer for the company, and has been in successful operation for over two years. The Tidewater Power Company operates an inter-urban line between Wilmington and Wrightsville Beach.

Four different colored lights are arranged on a small board suspended half way between the floor and ceiling, so that they may be seen from any point in the generator room. The circuits for the lights are opened and closed by three steam gages, which were fitted with contacts so as to make electrical connections whenever the steam pressure reaches specific values. If the steam pressure falls below 140 lb., a white light will burn and continue to burn until the pressure rises above this value.

All lights are out between pressures of 140 lb. and 150 lb. At the latter pressure a red lamp is lighted, and at 155 lb. a blue lamp comes on in addition to the red lamp, and if the pressure rises to 158 lb. a green lamp also lights and a Klaxon horn is sounded. As the safety valves are set for 163 lb., this arrangement gives ample warning and helps to provide even boiler operation. A similar set of signals is installed in the boiler room.

Blueprints of Repair Parts Save Mistakes

BY O. A. NORENE

Assistant Master Mechanic Omaha & Council Bluffs Street Railway

A BOOK of blueprints of standard repair parts is furnished to the store department and the shop and carhouse foremen of the Omaha & Council Bluffs Street Railway. These prints show standard elliptic and coil springs, brake levers and pins, brake slack adjusters and brake rigging, sizes and types of motor bolts,

etc., for different types of equipments; also spring tension on different types of brush-holders and sizes and types of carbons used on different types of motors. By referring to these prints no excuse can be given if wrong material is used.

Through-Bolt Housings Save Motor Trouble

BY JAMES A. DUFFY

Superintendent of Equipment Monongahela-West Penn Public Service Company

WE HAVE had on our property for a number of years several Westinghouse No. 306 motors. These are of the split-frame type, with housings or heads that originally

Application of Through Bolts to Motor Housings. Above, With One Vertical Bolt; Below, With Two Radial Bolts

were held to the upper half of the motor frame casting by two radial tap bolts. This arrangement holds the armature to the upper half of the shell when the lower half is swung down or removed for making repairs to the motor under the car. In addition these bolts help to keep the housing in place.

It was our experience that these housings would work loose in service and tend to wear at the seats, and at the same time the threaded holes in the housings would become badly worn. In many instances the threads in the housings were entirely worn out and the bolts would not hold, thus making it necessary to replace these worn housings by new ones.

In making replacements on some of these housings, a new through-bolt type of housing has been adopted. This was developed for these motors by the Westinghouse company. The results have been very satisfactory. The new housing has two bolts, each of which screws into a nut and clamps the housing to the motor shell through a draft on the nut. This type of housing is shown in the illustrations.

They are made for us from either malleable iron or cast steel, so that they are strong and durable.

The through bolts holding them in place are heat treated, which makes them strong and fatigue resisting. If the bolts wear at the threads they can be replaced readily by new ones at a small expense. If the threads rust, the nut can be cut off and the bolt is easily removed.

There are no threads in the housings to become worn out, so that a better fit is obtained throughout the life of the motor.

These housings can be obtained $\frac{1}{4}$ in. oversize on the diameter. This is of particular advantage for fitting in frames that have worn. These housings have three bolt holes so that they can be used not only on the No. 306 motor, which has two radial bolts, but on the old No. 101 motor using a single vertical bolt.

Since using these through-bolt type housings, we have eliminated all housing trouble. We have never had a through bolt get loose. In fact, it was one of the improvements that almost eliminated all motor troubles on the No. 306 motor on this property.

Brass Foundry Aids Repairs

THE Illinois Traction System has a brass foundry in connection with its Decatur shops and four men turn out from twelve to fourteen tons of brass castings per month. This is found of great assistance in producing such parts as brush-holders, grab-handle sockets, sash locks, window lifts and other car fixtures which are needed immediately and which would be given six months delivery or longer if bought in the open market.

Safety in the Wood Shop

THE ACCOMPANYING group of pictures shows the woodworking mill of the Nashville Railway & Light Company. This shop is particularly interesting for the precautions taken to safeguard employees from accidental contact with moving parts of machines, and to provide for their comfort. The equipment of the shops consists of the following machines: A 16-in. four-side molder, 9-in. four-side molder, blind slot molder, two-drum sander, band re-saw, band saw, plunger mortiser, column mortiser, 24-in. planer, 9-in. surfacer, double head shaper, and crossarm boxer.

Referring to the illustrations, No. 3 is a general view of the woodworking equipment. The band saw shown in No. 1 has the moving wheel well incased with a slot protection made of iron strips, which are riveted together. This gives an open construction, and at the same time fully protects the moving parts. An effective method of mounting guards and gages for a shaper is shown in No. 2. The exhaust piping for removing various cuttings is also to be seen in the background.

A surfacer with safety head and a grated protection that swings around to protect the cutting parts is shown in No. 4. The cutting tool is in a sort of pocket, so as to pre-

vent accidents. The 24-in. planer shown in No. 5 has the belt well shrouded, and the protection of moving parts, together with the piping for cuttings shown in No. 6, which is a molding machine, is particularly interesting. The small pulley shown in the center of this machine has a right and left-hand thread so as to keep the belt from dropping. A crossarm borer is shown in No. 7, with all moving parts protected.

Light Track Construction in Texas*

THE standard type of paved track-work adopted by the El Paso Electric Railway consists of 90-lb. A.R.A. rail, oak ties, spaced 24 in. on centers, 12 in. of crushed stone or gravel ballast, with a two-course concrete pavement of 7½ in. total thickness. This has proved to be both the

best and cheapest construction so far developed in Texas, according to the statement and is original with this company. Full advantage has been taken of the soil and climatic conditions peculiar to this section, in adopting an even lighter standard construction for paved tracks where Birney cars only are used. A.S.C.E. rail of 75-lb. section is laid on 6-in. x 8-in. x 7-ft. ties, with 6 in. of ballast under the ties, and a 6-in. concrete pavement. This has proved entirely satisfactory, both as a track structure and a durable street surface.

Track of this character has been built in 1923 for \$7.20 per foot, according to the company, while the 90-lb. construction cost about \$9. The latter is stated to be at least \$2 per foot cheaper than monolithic concrete with grooved rail and brick or asphalt pavement.

A further development in the track construction has been the use of steel ties laid on ballast, in conjunction with concrete pavement. Track of this type has been built that will undoubtedly compare favorably in ability to stand up under heavy traffic with any other in the country. It is somewhat more costly than wood tie construction, but should be even more durable.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association.

Safety Protection for Woodworking Tools in the Shops of the Nashville Railway & Light Company

No. 1. Slot work protection made of iron strips for wheel of band saw.
No. 2. Shaper with guards and gages in position.
No. 3. General view of woodworking equipment.

No. 4. Safety head attached to surfacer.
No. 5. Method of shrouding planer belt.

No. 7. Method of protecting moving parts on a crossarm borer.

New Equipment Available

Portable Vise and Pipe Bending Stand

A PORTABLE vise stand and pipe bender has just been developed by H. P. Martin & Sons, Owensboro, Ky. This stand is made of No. 16 sheet iron riveted and braced at the corners with angle irons, which also serve as pockets for four supporting legs. The legs are made of steel tubing and extend outward sufficiently to brace the stand against upsetting, tilting or skidding. The stand is supplied with either a hinge or chain vise, as desired. The vise is fixed rigidly to the top of the frame at one end in such a position that short nipples can be threaded without injury to the workman's

roller on the rear support to keep correct alignment and to enable one man to move the full length of pipe forward or backward without unnecessary labor. The weight of the 4½-in. size machine is 172 lb., with a hinge vise and 156 lb. with a chain vise.

Headlight with Special Metal Reflector

A HEADLIGHT with special case and sealed silver-plated reflectors has been developed by the Pyle National Company, Chicago, Ill., for use on electric locomotives or inter-urban cars. The parabolic reflector is 18 in. x 9 in. and is spun from heavy-gage sheet copper. The inside surface

nections, or disturbing the focal adjustments for renewing lamps. The headlight cases are made in four different styles.

Convenient Size Electric Drill

A N ELECTRIC drill for holes up to ¾ in. in diameter has just been placed on the market by the Argyle Railway Supply Company, Chicago, Ill. The drill weighs about 5 lb. and is operated by a special Westinghouse motor with a full load speed of 850 r.p.m. The motor can be operated on either direct or alternating current. The handle grip of the drill is kept cool by a ventilation system which brings cool air into the back of the handle. Incoming air is distributed to all parts of the motor.

A special switch for operating the electric drill has been developed by

Portable Stand and Pipe-Bending Tool Set Up

Large Size Pipe-Bending Stand Ready for Transporting

hand. A guide and rest for the pipe while it is being cut or threaded is provided at the end of the frame opposite to that on which the vise is installed. This assists in keeping bends free from kinks and also in locating the bends accurately.

The stand can be dismantled by pulling the legs out of their sockets and fastening them in the vise. Convenient handles are provided for carrying. As the sides of the frame are open with a brace across the bottom, the frame provides a convenient rest for pipe tools where oil from the stocks will drain off without running down the handle. The equipment weighs 60 lb. and can be assembled or dismantled in half a minute. It occupies a space of 6 ft. x 8 ft.

The outfits are built in two sizes, one for pipe ranging from ½ in. to 2½ in. in diameter and another for heavier pipes up to 4½ in. diameter. The larger size is provided with a

is prepared for the quadruple silver plating by grinding and polishing operations.

The case is of No. 16 gage copper-bearing steel and is protected on the outside by two coats of flexible black baking enamel, and on the inside by the application of an aluminizing preparation. A machine finished, cast aluminum-alloy door frame forms the front of the case and a slot hinged door ring, which is also machine-finished aluminum alloy casting, is sealed against a heavy gasket by the tightening of five wing nuts on hinged bolts. The front glass is made of clear convex heat-resisting glass and is held and sealed against the door-ring gasket by means of bronze fasteners.

Lamp replacements are made by loosening the bronze ring nuts and swinging the door open. This construction makes the fitting of front glasses convenient and avoids the necessity of breaking electrical con-

the Cutler-Hammer Manufacturing Company, so that the drill runs only when the operator is actually gripping it. The position and operation of the switch is natural, and can be released readily without shifting the hand. The drill chuck bearings and two armature bearings have bronze bushings and spring oilers which retain a considerable amount of lubricant. The thrust in drilling is taken up on a ball bearing which works between two hardened ground steel surfaces. The gears are packed in grease. The pinion is of steel with helical teeth, cut directly on the armature shaft. The chuck is of the Goodell-Pratt keyless type, requiring no tools for opening or closing. To prevent the armature from turning, when opening or closing the chuck it is only necessary to press the spring stop into the slot in the end of the armature shaft. This locks the shaft and the chuck may then be turned without difficulty.

The News of the Industry

Subway Financing Sought

Detroit Commission Prepared to Present Plans at Special Session of Michigan Legislature

The Detroit Rapid Transit Commission will seek the aid of the state Legislature at a special session to be convened in December, to secure the passage of an amendment to the rapid transit act adopted last spring by the Legislature to pave the way for financing the construction of a system consisting of subways or elevated railways.

The commission's plans for financing rapid transit construction in Detroit are embodied in a tentative amendment drafted by P. J. M. Hally, special counsel for the Rapid Transit Commission. It is pointed out that funds for rapid transit construction could be secured:

1. By levying a special ad valorem tax on the total wealth of the city.
2. By assessing benefits of rapid transit on the local area benefited in such manner and in such proportion of the cost of rapid transit construction as the legislative body of the city may determine.
3. By issuing bonds against the rapid transit property.
4. By combining the foregoing.

It is the desire of the commission to lay the rapid transit plan before the electors at the election next April. If the amended bill is passed by the Legislature it is the intention of the commission to seek its submission to the voters, together with a "definition of a general plan of assessment" at a special election to be called, probably in February. Then the comprehensive plan for rapid transit which is being worked out by the engineers for the commission would be presented to the voters in the spring.

ENGINEER OUTLINES WORK

The work to date as outlined by Major John P. Hollihan, engineer engaged in studies and surveys for the rapid transit system, includes the determination of a satisfactory plan of financing a rapid transit system, without using the faith and credit of the city. In this work it was necessary to go thoroughly into assessed values of property throughout the city; and to estimate the probable increase in values that would accrue to property directly benefited.

The engineers of the commission have conferred with the City Plan Commission on the thoroughfare plan covering the proposed metropolitan area, with a view to enabling the commission to present a final plan for the joint consideration of the department of public works, department of parks and boulevards, the street railway department and the rapid transit commission. These bodies should, in the opinion of Mayor Dore-

mus, determine the thoroughfares required to relieve the present motor vehicle traffic inside the city limits and indicate for the consideration of the adjoining municipalities and counties, the probable future requirements of Detroit as the city expands. The commission is also conferring with the Detroit Bureau of Governmental Research on the proposed metropolitan area. The work of the commission is being carried on with the aid of an appropriation of \$70,000 by the City Council.

Municipal Ownership Recommended for Phoenix

A special citizens' committee has recommended to the City Commission of Phoenix, Ariz., that the system of the Phoenix Railway be municipally owned. It is proposed to purchase the system from General M. H. Sherman, Los Angeles, Cal., its owner, in thirty annual payments of \$12,000, without interest, the gross sum being about equal to the valuation placed on the railway by the State. If the plan for the purchase is carried out as proposed the road would be leased to the Central Arizona Light & Power Company for operation by it for twenty years. Meanwhile the city would be called upon to spend \$400,000 to rehabilitate the system and to provide \$190,000 for paving between the tracks. Most of the money so required would be raised by the sale of bonds. It is said that the railway in Phoenix is operated at a loss of about \$15,000 annually, due principally to the operation of an inter-urban line between Phoenix and Glendale district.

The report of the committee grew out of the controversy between the company and the city over franchise matters and the alleged inability of the company to meet the terms with regard to paving included in the original grant to the railway.

One Day Off Compulsory.—One day off in eight without pay except in emergency cases will be mandatory upon employees of the Seattle Municipal Railway beginning Jan. 1, 1924. A resolution to this effect has been unanimously passed by the City Council, but Mayor Brown intimated that he would veto the measure, declaring that it would be impossible for the railway to put the regulation in effect by the date named. The ordinance means the hiring of between seventy and eighty men, and D. W. Henderson, superintendent of railways, states that it will be impossible to train that number in the time given.

Non-Union Pledge Void

Circuit Court Rules Against Law Forbidding Employers to Exact Non-Union Pledges

The California state law forbidding employers to exact pledges from employees not to join labor unions has been held void. Decision to this effect was handed down by the United States Circuit Court of Appeals on Nov. 13 in a case affecting the Pacific Electric Railway. The opinion of the Circuit Court affirms the decision handed down by the United States District Court of Los Angeles, which enjoined labor unions from organizing the non-union men of the Pacific Electric Railway.

The injunction is made permanent. It is directed against the Brotherhood of Railway Trainmen and the Brotherhood of Locomotive Engineers. It said:

Activities without lawful excuse, engaged in by the unions, were: Unionizing the employees of the railway and the drawing of them into a controversy in which they had no substantial cause for complaint; calling strikes after organizing 1,200 of the 1,500 employees; striking when the country was at war in the face of the Presidential proclamation that there should be no strikes or lockouts during the war, and striking while the complaints of the employees were being submitted by the railway to a representative of the United States Department of Labor.

The court held these activities interrupted the railway company's business in intrastate and interstate commerce to its irreparable damage.

On Aug. 16, 1919, certain employees of the Pacific Electric Railway elected to strike. It was alleged that the men had been influenced in this decision by certain officials of the Brotherhood of Railway Trainmen and Brotherhood of Locomotive Engineers.

The results of the strike, engaged in by a portion of the company's employees, were reviewed in this paper for Sept. 6, 1919.

In July, 1918, a similar strike was attempted, but this strike, undertaken during the war, was quickly ended by the railway securing in the Federal courts an injunction against certain officials of the trainmen's unions restricting interference between the Pacific Electric Railway and its employees.

Since obtaining this injunction during the first strike in July, 1918, it was possible to obtain an order from the courts in August, 1919, during the second strike making the restraining order effective during the second strike.

In March, 1922, the Pacific Electric Railway sought to have the Federal court make this injunction against strikers permanent. This move was reviewed in the *ELECTRIC RAILWAY JOURNAL* of March 18, 1922, page 489. Another reference to the matter was published on page 721, Oct. 28, 1922.

More Passengers But Less Revenue with Five-Cent Fare

Definite Conclusions Impossible from Results of First Month's Operation of New Fare System on Public Service Railway—Bus Competition Continues to Be the Crux of the Problem

ALTHOUGH the total number of passengers carried by the Public Service Railway of New Jersey during the month of October, 1923, was approximately 400,000 more than the number carried during October, 1922, the total revenue was smaller and a deficit of \$382,753 resulted. Except for a changed rate of fare the operation of the railway was about the same as in the corresponding month of the previous year, with only a nominal increase in the number of car-miles and car-hours.

The compilation of the figures for the first month's operation under the

than last; the expenditures for equipment were slightly higher; power expenses were markedly less and other items showed very little change except that for conducting transportation, which was more than \$100,000 higher.

NUMBER OF REVENUE FARES INCREASE

The number of revenue fares for the first month of the new system was much greater than in previous months, being 33,508,564 as against 27,187,790 in October, 1922. This large increase,

existing system of compiling the figures. While this was true also of the figures for October, 1922, there were then few two-zone riders compared with the number of such riders under the present system.

It would appear that the railway traffic is still suffering somewhat from the effects of the seven-weeks shutdown this summer. At least the bus traffic in some places is heavier than before the strike. In the Newark area, for example, the number of passengers carried by buses in October of this year was 8,066,263 as against 7,062,333 a year ago. An influential factor in the situation has been the exceptionally fine weather which has prevailed all during the summer and fall, and this has undoubtedly had a tendency to favor the bus business.

Under the circumstances it would be

FIRST MONTH OF 5-CENT FARE ON PUBLIC SERVICE RAILWAY COMPARED WITH CORRESPONDING MONTH OF PREVIOUS YEAR

	October, 1923	October, 1922
Total operating revenue.....	\$1,836,185	\$2,190,098
Total operating expenses.....	1,577,784	1,482,321
Operating ratio, per cent....	85.93	67.68
Gross income.....	\$55,737	\$505,777
Total income deductions..	438,490	446,541
Net income or deficit....	\$382,753	\$59,235
Revenue passengers carried	33,508,564	27,187,790
Transfer passengers carried	139,740	6,060,930
Total passengers carried....	33,648,304	33,248,720

new fare system was made public on Nov. 26. Passenger revenue for October, 1923, was 36.59 cents per car-mile as against 45.24 cents per car-mile a year ago, and \$3.43 per car-hour this year as against \$4.27 in October, 1922. The total operating revenue was \$1,836,185, from which operating expenses of \$1,577,784 were deducted, giving an operating ratio of 85.93 per cent instead of 67.68 per cent. The gross income for the month of October, 1923, was \$55,737 as against \$505,777 in 1922.

Operating expenses increased greatly due almost entirely to higher wages which were granted the company's employees as a result of the settlement of last summer's strike. The expenses for way and structures were less this year

Bus Blocks Entrance to Trolley—A Familiar Scene

however, is offset by the loss in transfer passengers which decreased from more than 6,000,000 to only about 140,000. Thus, the total number of passengers carried was 33,648,304, a slight increase over the number carried during October a year ago which was 33,248,720.

It is impossible to tell exactly what this means in the way of increased riding because a single individual who rides in two zones and pays two fares is listed as two passengers under the

premature to draw any definite conclusions from the figures of the first month's operation. It is said that the railway income is steadily increasing and this tendency may be expected to become more pronounced as winter approaches and bad weather sets in. However, the average fare per revenue passenger has been reduced from 7.83 cents to only 5.31 cents which means that there must be a very large increase in riding before the railway revenue will equal what it used to be under the old fare. This outcome appears to be doubtful as long as the destructive bus competition continues on the same streets with the railway.

CAMDEN BUSES BOUGHT BY RAILWAY

In the Camden district the company has already taken steps to get control of the situation by buying up a large number of buses. With these vehicles in the hands of the railway it is planned to co-ordinate the bus and street car services.

Elsewhere the railway has undertaken plans to reduce the cost of operation. It has been announced that one-man cars will replace the present two-man cars on several lines in Newark and it is expected that the same plan will be tried by the company on other lines.

Bus and Trolley Give Similar Service at Same Time on Same Street

Legislation Needed to Further Electrification in New York

A plan for the solution of the west side traffic problem by the construction of an elevated freight railroad was presented on Nov. 26 by the New York Central Railroad at a joint hearing of the Transit Commission and the Public Service Commission.

The hearing was upon the company's application to the Public Service Commission for an order specifying the method of the electrification of its west side line in conformity with the Kaufmann law, passed by the last Legislature, and an application to the Transit Commission for a change of grade on all streets crossing the west side tracks, under the general law placing one-half of the expense upon the railroad, one-fourth on the state and one-fourth on the city.

The plan presented by the railroad provides for the construction of an elevated railroad most of the way from Spring Street to the Harlem River, eliminating all grade crossings. The total cost is estimated at between \$60,000,000 and \$70,000,000, which the railroad would pay except the cost of eliminating the grade crossings, estimated at from \$15,000,000 to \$25,000,000, which would be divided by the company, state and city.

Ira A. Place, vice-president of the New York Central, in charge of its law department, said that while the two questions of elimination of grade crossings and electrification were legally separated, they should be considered together.

George McAneny, chairman of the Transit Commission, expressed belief that legislation would be needed to accomplish any result. Mr. McAneny explained that a law was passed in 1911 permitted the city to reach an agreement with the railroad on a plan and that a law of 1917 permitted the commission to prepare a plan for submission to the railroad with the railroad paying the cost. Mr. McAneny said that, in any event, appeal would have to be made to the Legislature to get an appropriation under the general change of grade law for the relocation of the tracks. An adjournment was taken to Dec. 6.

Pacific Electric Railway Employees to Be Provided with Insurance

Employees of the Pacific Electric Railway, Los Angeles, are to participate in the group insurance plan recently announced by the Southern Pacific Company for all its employees. More than 7,000 employees of the Pacific Electric System will enjoy the benefits by the ruling of the Southern Pacific Company that subsidiary company employees are entitled to the insurance provisions made.

Employees in the service six months receive \$250 insurance free of cost.

The plan becomes effective when 75 per cent of eligible employees of the

company subscribes for the insurance, but not before Jan. 1, 1924.

The policy taken out by the Southern Pacific Company is estimated to exceed \$100,000,000. The insurance plan affects 90,000 employees of the Southern Pacific interests. The policy is to be written by the Metropolitan Insurance Company.

Target of Opinions in Massachusetts—One-Man Cars

The one-man car is still being assailed in Massachusetts. William Walsh of the Massachusetts branch of the American Federation of Labor and a former business agent of the Boston Street Carmen's union has asserted that he has asked for and received promise of support of the Boston Central Labor Union in the initiative and referendum movement to eliminate the one-man cars in the State. Petitions asking for the initiative and referendum are being circulated. An attack on the one-man car is planned in Boston where a group of men headed by an attorney has announced intention to petition the Legislature to prohibit the use of the one-man cars. The Attorney General has approved the form of the petition, which provides that if the proposed law is defeated by the Legislature it shall go to the people for referendum vote.

Chairman Jackson of the Boston Elevated Railway trustees has notified Mayor Curley of that city that one-man cars have come to stay. They are used only on routes, Mr. Jackson said, where cars run by two men would be unprofitable. The one-man controversy in Massachusetts has been referred to previously in the *ELECTRIC RAILWAY JOURNAL*.

Arbitration Next Step in Springfield

Arbitration will be necessary before the new contract between the employees of the Worcester Consolidated Street Railway, the Springfield Street Railway and the officials of the trolley lines are drawn. The present contract expires Dec. 31. In accordance with the terms of the present contract the employees and employers have exchanged proposals for the new contract, but both sides have made demands which have put them far from agreement. Bentley W. Warren, Boston, representing the company, and James H. Vahey, representing the men, have had several conferences since the union committee and trolley officials met in an effort to reach some basis that would permit resumption of negotiations for an agreement, but without making progress. In the arbitration proceedings Mr. Warren will be the companies' representative and Mr. Vahey will act for the carmen. They will select the third man.

The major demands of the trolley men are for an eight-hour day, an increase in the maximum pay for uniformed men from 58 cents to 80 cents

an hour and for operators of one-man cars an increase from 66 to 95 cents an hour with a 30 per cent increase for all miscellaneous employees.

The company has proposed maintaining the present schedule of wages if certain bonuses are eliminated, but suggests that if the bonuses are retained the pay of uniformed men should be reduced 5 cents an hour. President Clark V. Wood has also told the men that the increase they ask with the eight-hour day would add \$750,000 to the annual payroll and that the company cannot do this on the present revenue with a 10-cent fare, and could not do it with an increased fare because the decrease in riding would keep the income down.

Peter Witt for Municipal Ownership.

—Councilman-elect Peter Witt, former street railway commissioner at Cleveland, urges that the city take over the property of the Cleveland Railway at its estimated value of \$35,000,000. Mr. Witt says it can be done "without costing the taxpayers a penny." As he sees it the money now paid by car riders in the shape of taxes totals \$1,378,933 a year and is constantly increasing. Mr. Witt says the money thus saved, which now goes to Washington, Columbus and townships in the county outside of the city, will more than pay for the present outstanding obligations of the Cleveland Railway in less than twenty-five years.

Must Remove Snow.—The Boston & Worcester, Milford & Uxbridge and Springfield Street Railways will be obliged to remove all snow piled by their plows onto walks previously cleared by householders, according to a recent decision of the Massachusetts Department of Public Utilities. They must also remove snow which the plows throw in the highways cleared by the various towns and cities of Massachusetts through which they operate lines.

Pay Increases for More Detroit Men.

—The October payroll of the Department of Street Railways at Detroit was increased approximately \$10,000 due to advances in pay granted by the Street Railway Commission to employees of the system other than platform men.

Houston Company States Its Case.

"That Houston May Fulfill Her Destiny" is the title of an instructive pamphlet issued for the patrons of the Houston Electric Company. The company, in publishing the pamphlet, states that it wants its patrons to know what it is doing and has done during the past three years to furnish transportation in its city. It gives, in detail, the various construction and improvement undertakings and the money that was involved in each improvement. But the company urges upon people the need for greater improvement as the expansion is pressing down heavily on them; that millions of dollars more will be necessary during the next few years, and asks for the support and confidence of the people to insure the success of the transportation system.

Financial and Corporate

Committee Reports at Montreal

Favorable Findings Presented by Shareholders Who Inquired Into Affairs of Holding Company

The committee that was appointed by shareholders of the Montreal Tramways & Power Company, Montreal, Que., to look into the affairs of that corporation has made a report. The *Canadian Financial Post* says that the report is on the whole favorable to the present directors and management, but that there may be a renewal of the fight for control that was waged during the summer.

DATA FURNISHED STOCKHOLDERS

The report provides shareholders with data concerning the profits and losses of the company since formation eleven years ago. This is the first time shareholders had any information concerning the company's operations between 1912 and 1920.

The committee's statement indicates that the total income for the years from 1912 to 1922 was \$5,978,062, and the total expenditures during the period were \$7,752,699. This made a deficit of \$1,774,636 for the company as of the period ended Nov. 30, 1922.

The company had losses in six years and profits in five of the eleven years under review and the record for each year was as follows:

Year	Income	Expenditure
1912	\$282,500	\$690,184
1913	503,047	457,913
1914	513,544	442,953
1915	543,082	846,046
1916	558,669	493,762
1917	560,898	863,190
1918	475,471	534,360
1919	463,760	1,409,514
1920	814,224	719,513
1921	587,054	717,724
1922	675,811	577,536

This succession of losses is blamed upon the fact that it was a very serious task to finance the company owing to opposition encountered at the start, and later to conditions created by the war. This was responsible for high cost of short date financing and high premiums on United States funds. Under more favorable conditions, says the report, this expense would have been curtailed, and sources of revenue increased considerably by a fuller development of the assets of the company.

OPTION AGREEMENT TO BE EXERCISED

The report also deals with the point that has been criticized by shareholders, namely, the transfer of 59,500 common shares of the Canadian Light & Power Company to the Montreal Public Service Corporation. These shares were handed over as collateral, when Montreal Public Service made a bond issue

of \$2,550,000 in 1919. There was an agreement to be made that Tramways & Power Company was to have the right to repurchase these securities together with \$1,700,000 of Canadian Light & Power Company 5 per cent bonds, due 1949, for the sum of \$2,050,000. The committee was informed by officers of the company that the transaction was treated as a temporary sale to meet the suggestions of the solicitors, but the intent between the parties was that the securities were pledged with right of redemption. The report recommends that the agreement of option be executed without further delay.

The Montreal Tramways & Power Company owns a majority of the ordinary stock of the Montreal Tramway and the stock of the Canadian Light & Power Company.

Order Entered to Dismantle Famous Colorado Line

The famous Colorado Springs & Cripple Creek District Railway, once referred to by Theodore Roosevelt as offering "the one-day trip that bankrupts the English language," has finally been declared dead *de jure*, it having died *de facto* a considerable time ago.

In May, 1919, the United States District Court appointed a receiver for the property on application of trustees for the bondholders. In May, 1920, the same court authorized the receiver to discontinue operation of the line except as to a small portion thereof. The Public Utilities Commission of Colorado thereupon filed petition for modification or vacating of the last mentioned order contending that since the property was located wholly within the State of Colorado the question of its operation or discontinuance was with the state commission. In October, 1922, the receiver sold the property at foreclosure and the purchaser proceeded to begin to dismantle and junk the line. Interested citizens petitioned the state commission to take jurisdiction on its own motion and protect their rights.

After a hearing the commission ruled that a foreclosure sale transferred property subject to all duties and responsibilities under which the original owner held the property; that the purchaser at foreclosure was without right to abandon public service except by permission of the lawful authority having fully jurisdiction thereof.

At the close of the hearing an agreement entered into by all parties sanctioned an order to permit the dismantling except as to certain portions, which order was entered.

The road consisted of 75 miles of track.

\$8,100,000 Value Fixed at Norfolk

Sum Decided Upon by State Commission \$2,000,000 Less Than Company's Claim

The valuation of the Norfolk railway properties of the Virginia Railway & Power Company was fixed on Nov. 24 by the State Corporation Commission as \$8,100,000. This is less by more than \$2,000,000 than the sum claimed by the company and more by about the same amount than the valuation asserted by the city of Norfolk. The company's 7-cent fare, granted some time ago by the commission, will be continued in force, for the commission has pointed out that even at the valuation claimed by the city, the earnings of the company at 7 cents are not more than 4 per cent on the valuation.

The company claimed a valuation of \$10,639,084 and the city contended for \$6,152,532.

The commission states in its decision that in the five months from June until October during which the 7-cent fare, with four tokens for a quarter, was existent, the company's net earnings applicable to return after payment of taxes, depreciation and renewal reserve, were \$181,070, as compared with \$165,660 for the corresponding period of last year. The commission gives it as its opinion that the 7-cent fare should stand.

Major Alexander Forward, commissioner in charge of transportation problems, rendered the opinion.

The commission decided to include in the company's valuation the summer resort owned by it at Norfolk and rented for a sum which is less than enough to pay the carrying charges. The decision holds that if it were not for the summer resort there would be insufficient permanent travel from the limited number of residents on the Ocean View line to warrant its continuance, but that the city undoubtedly would not want the line discontinued and that in view of these considerations the property should be allowed as a part of the valuation.

From the company's valuation the commission has deducted \$1,091,000 for accrued depreciation. The claim of the city on account of this item was \$1,960,735. Minor deductions were made for other items.

Receiver Appointed for Washington-Virginia Line

On petition of five Philadelphia trust companies acting in behalf of bondholders, the Washington-Virginia Railway was declared insolvent by the Circuit Court of Fairfax County, Va., on Nov. 23. At the request of the petitioners, Arthur L. Reynolds, manager of the company, was appointed receiver. The company operates several interurban lines between Washington and near-by points in Virginia, among them the line to Mount Vernon. Insolvency

was admitted by the company in its answer to the petition. An intervening petition, filed by Mattie M. Newcomer, a stockholder, was rejected by Judge Samuel G. Brent.

New Plan Submitted for Service Between Kewanee and Galva

Kewanee, Ill., has not given up its effort to get back its city line and the interurban line from Kewanee to Galva. Despite the fact that the first plan to sell \$100,000 in stock to refinance the Galesburg & Kewanee Electric Railway failed, merchants, manufacturers and city officials have devised another plan, the adoption of which will make possible the resumption of service at an early date.

Opinion is unanimous that the loss of the lines would be a severe handicap to the community. At an enthusiastic meeting of the business interests B. F. Parker, vice-president of the Kewanee Boiler Company, and general chairman of the Pittsburgh-plus commission, presented a plan which was adopted.

This plan included an offering to the public of a \$75,000 issue, secured by first mortgage on all the property of the company including the \$60,000 in new equipment; \$45,000 of capital stock unsecured; provision for the sale of certain pieces of real estate owned by the company and some of the old equipment such as cars to the amount of about \$20,000. This would leave a total of \$12,000, according to the arrangements, necessary to refinance the proposition, including the purchase of new cars and other equipment. The original figure estimated as necessary to cover everything was \$140,000. The new figure, \$120,000, would be covered by the bond issue of \$75,000 and the stock issue of \$45,000. The new arrangement also calls for the selling of a block of tickets, good within a year, to the largest possible number. It is said that many persons who could not take a \$50 bond might be willing to expend \$15 or \$25 for tickets. This would bring money in for immediate use and would help the company in many ways. The difficulties in Kewanee have been referred to previously in these pages.

Minority Report by Pittsburgh Receiver

Charles A. Fagan, one of the receivers of the Pittsburgh Railways, acting independently of his colleagues, W. D. George and S. L. Tone, has filed an exception to the plans for the reorganization of the company to follow the lifting of the receivership. In a petition filed by his attorneys in the United States Court Mr. Fagan declares that the company is still "manifestly insolvent."

In his attitude on this matter Mr. Fagan takes direct issue with former Judge Henry G. Wasson, who as special master, delegated by the court to take testimony and advise it as to whether the reorganization was possible, recommended the reorganization.

Mr. Fagan says that he disagrees with the master's conclusions in view of the present insolvency of the company, the absence of any offer to cure the insolvency, the failure to provide for the refunding or extension of bonded indebtedness now in default, and the failure to adduce sufficient evidence to prove that the corporation can operate at a profit and make ends meet in the next several years.

According to Mr. Fagan the general tenor of the master's report is to the effect that if the receivership should be terminated at the present time there would be ample cash and other assets on hand to meet all the current obligations as they mature and leave a substantial amount for working capital. In Mr. Fagan's opinion this is a conclusion unwarranted by the evidence.

Further Progress Reported in Kansas City Reorganization

The committee representing the bondholders of the Kansas City Railways reached a new agreement on Nov. 24 with the lawyers who represent the holders of personal injury judgments by which these claimants will receive 50 cents on a dollar in cash and the remainder of their claims in first mortgage bonds of the new company to be organized after the receivership has been lifted. The total of the outstanding accident claims is more than \$2,000,000.

To protect the worth of the bonds which the judgment holders will receive it has been agreed that the total initial bond issue against the reorganized property shall not exceed \$20,000,000. Provision is also made to reimburse the bondholders' protective committee for \$500,000 advanced to pay state taxes prior to the receivership.

The agreement stipulates that the parties shall collaborate to obtain an equitable adjustment of all the matters involved in the reorganization.

Judge Stone of the Federal court expressed himself as pleased at the progress made and said that on the determination of the priority of claims against the railways will depend the progress of negotiations for the reorganization of the property. The hearing set for Nov. 26 was postponed until Dec. 27. If further progress toward arranging the reorganization is reported on Dec. 27 Judge Stone said that he will continue the hearing until Jan. 7.

An order issued by the court to pay a group of claims against the old receivership was rescinded by Judge Stone, pending publication of a notice to claimants.

Should a foreclosure be necessary the bonds would be issued by the reorganized company, but if the present company were to continue, then the old bonds must be retired and new ones issued by it.

Holders of the second mortgage bonds and the notes are so widely scattered with respect to their residence that fully a month will be required to consult all creditors. If these holds can

be induced to accept the plan as now proposed, then a hearing on the priority of claims will be avoided.

Receivership of Brooklyn Line Expected to Be Lifted Soon

The Brooklyn, Queens County & Suburban Railroad, Brooklyn, N. Y., is expected soon to emerge from the hands of the receiver as the result of an agreement reached between the Brooklyn City Railroad and the reorganization committee of the Brooklyn-Manhattan Transit Corporation.

Until the present, the Brooklyn, Queens County & Suburban Company has not been considered in the reorganization plan of the Brooklyn-Manhattan on account of the claims against this road by the Brooklyn City Railroad. At the time of the major reorganization it was impossible to make an adjustment with the Brooklyn City Railroad so that the Queens County line remained in the hands of the receiver. Lindley M. Garrison was appointed July 14, 1919.

The plan for the reorganization of the property does not contemplate any foreclosure sale.

The agreement that has just been reached between the Brooklyn City Railroad and the Brooklyn-Manhattan Transit Corporation has to do only with the bonds of the Queens County & Suburban Company. It does not apply in any way to the construction suit involving \$10,000,000 between the two railway companies, which is still pending.

The Brooklyn, Queens County & Suburban Railroad has 64 miles of track. Its assets according to the 1922 report were \$14,094,904.

McKinley-Studebaker Group Buys Into Kansas City Light

The Illinois Power & Light Corporation, which was formed a few months ago to consolidate the McKinley and Studebaker public utility properties, has acquired through purchase J. Ogden Armour's interest in the Kansas City Power Securities Company. E. H. Rollins & Sons, bankers, Chicago and New York, acted for the purchaser. The exact number of shares transferred has not been made public, but it can be stated that the transaction involves approximately 33 per cent of the Kansas City Power Securities Company's outstanding capitalization, which consists of 40,000 shares of common stock and 40,000 shares of preferred stock.

The Kansas City Power Securities Company, in which Mr. Armour was the most important individual stockholder, is a holding company owning the entire capital stock of the Kansas City Power & Light Company, which in turn has numerous subsidiaries. This transaction does not involve Mr. Armour's holdings in the Kansas City Railways. Since the reorganization of the utilities in Kansas City in 1916 the Kansas City Power Securities Company

has had no control over the Kansas City Railways.

The purchase of the stock by the Illinois Power & Light Corporation has been approved by the Illinois Commerce Commission.

Auction Sales in New York

At the auction rooms of A. H. Muller & Sons there were sold on Nov. 28 the following securities:

4,201 shares Interborough Consolidated Corporation, preferred, \$100 lot.
3,322 shares Interborough Consolidated Corporation, common, \$160 lot.
100 shares of Interborough Consolidated Corporation, common, \$2 lot.
200 shares Interborough Consolidated Corporation, preferred, \$14 lot.
\$6,250 Central New York Southern Railroad Corporation deposit receipt under subscription agreement, dated Oct. 2, 1913, \$100 lot.

Net Income Shows Increase.—For the four months ended Oct. 31, 1923, the passenger revenue of the Brooklyn City Railroad, Brooklyn, N. Y., was \$3,907,962, against \$3,897,784 for the same four months a year ago. The net corporate income increased from \$615,248 for the four months ended Oct. 31, 1922, to \$644,544 for the same four months of the current year.

Valuations Fixed in Michigan.—The Michigan Public Utilities Commission has fixed the following valuations based on reproduction costs, less depreciation, on Michigan electric lines: Michigan Railroad, \$9,418,140; Michigan United Railways, \$10,139,542; Grand Rapids, Holland & Chicago, \$2,462,396; Grand Rapids, Grand Haven & Muskegon, \$2,562,489; Southern Michigan Railway, \$1,618,645; Benton Harbor-St. Joe Railway & Light, \$2,140,613. The total valuation aggregates \$28,341,326.

"Be a Partner."—The Wisconsin Public Service Corporation has recently issued a handsomely colored booklet of fifteen pages entitled "Be a Partner." The booklet was issued in order that the widespread movement among public utility companies to provide home investors with sound investments and to perpetuate co-operative relations of the company with its customers and employees may gain greater headway.

Additional Bonds Sold.—The National City Company recently sold at 92½ and interest an additional block of \$380,000 general mortgage and refunding mortgage gold bonds of the Northern Ohio Traction & Light Company, Akron, Ohio. The bonds are known as series A, 6 per cent. They are dated March 1, 1922, and are due March 1, 1947.

Issue Covers Completed Improvements.—The \$107,000 issue of bonds by the Fort Smith Light & Traction Company, Fort Smith, Ark., authorized by the State Commission, is not intended for new improvements to the system, but for work already completed. This issue was referred to in the Nov. 24 issue of the ELECTRIC RAILWAY JOURNAL.

Gold Notes Offered.—A syndicate is offering at 98½ and interest to yield more than 6.70 per cent \$10,000,000 of convertible 6½ per cent gold notes of the Northern States Power Company,

Fargo, N. D. The notes are dated Nov. 1, 1923, and are due Nov. 1, 1933. The proceeds from the sale of these notes will be used to redeem the entire issue of the company's ten-year notes due April 1, 1926, now outstanding in the amount of \$7,805,000 and to reimburse the company in part for expenditures heretofore incurred for additions extensions and betterments to the properties of the system.

Dividends Resumed on Common Stock.—The Duluth-Superior Traction Company, Duluth, Minn., has resumed dividends on its common stock by the declaration of a quarterly dividend of \$1 a share. This dividend and the regular quarterly dividend of \$1 a share on the preferred stock are payable on Jan. 2 to stock of record of Dec. 15. The company paid the last quarterly dividend of \$1 a share on Oct. 1, 1918, on the common stock. The gross revenues of the Duluth-Superior Traction Company for the nine months ended Sept. 30, 1923, amounted to \$1,413,990 against \$1,314,036. The net income after the consideration of fixed charges and taxes was \$75,496 for the nine months of this year, against \$52,963 for the nine months' period ended Sept. 30, 1922.

Booklet Describes Property.—The Byllesby Engineering & Management Corporation has prepared a twenty-page booklet entitled "Back of the Investment," illustrating the properties comprising the Northern States Power System, Minneapolis, Minn. Photographic views made from an airplane of the system is an added feature included in the booklet.

Figures Show Tax Distribution.—According to figures presented to the National Tax Association recently by John E. Walker, former tax adviser to the United States Treasury Department, more than 8 per cent of the total tax burden of the country in 1921 was collected from three agencies of transportation, the motor car, steam railroad and electric railways.

Surplus Falls Off.—The gross earnings of the Lake Shore Electric Railway, Cleveland, Ohio, from Jan. 1, 1923, to Sept. 31 were \$2,084,953, against \$1,866,401 for the same period a year ago. The surplus shows a falling off from \$158,894 for the period from Jan. 1 to Sept. 31, 1922, to \$138,807 for the same months of the current year.

Net Receipts.—\$3,855.—The municipally owned Norton, Taunton & Attleboro Street Railway, Norton, Mass., shows for the nine months ending Sept. 30 gross earnings of \$57,241 and operating expenses for the same period of \$53,385, leaving net receipts of \$3,855. Four \$1,000 notes due the municipalities from the railway have been paid in this period, together with the interest accrued.

Additional Refunding Bonds Offered.—Tucker Anthony & Company, New York, N. Y., is heading a syndicate which is offering for subscription at 99½ and interest, to yield more than 6½ per cent, an additional issue of \$1,039,500 of

first mortgage and refunding lien sinking fund 6½ per cent gold bonds, Series A, of the Consolidated Power & Light Company, Huntington, W. Va. The bonds are dated March 1, 1923, and are due on March 1, 1943. The company owns and operates the entire electric power and light and electric railway business in Huntington, W. Va., Roanoke and Lynchburg, Va., and surrounding communities, as well as the gas business in Lynchburg, Va. The system also does the entire electric light and power and electric railway business in Ironton, Ohio, Ashland and Catlettsburg, Ky., and the intermediate territory.

Bonds Offered.—Halsey, Stuart & Co., New York, N. Y., are offering \$1,500,000 of first lien and refunding convertible 6 per cent bonds, series A, of the Monongahela-West Penn Public Service Company. The bonds are offered at \$96.25 and accrued interest to yield about 7 per cent.

Atlanta Lines Report Increase.—Cars of the Georgia Railway & Power Company, Atlanta, carried 228,110 more passengers during October, 1923, than during October, 1922. The increase in revenue amounted to \$14,502. The total number of passengers transported in October this year was 6,724,071, with gross revenue of \$456,744. Substantial increases have been shown nearly every month this year over the corresponding month of last year.

Assessments Completed.—A total valuation of \$104,410,000, on which a tax of \$2,171,140 will be paid, has been placed on the properties of the Wisconsin light, heat, power and electric railway companies by the Wisconsin Tax Commission, which has just completed its report. The assessment on the Milwaukee Electric Railway & Light Company is based on a value of \$59,000,000.

Partial Abandonment Approved.—The Public Service Commission has approved a declaration of abandonment by the Southern New York Power & Railway Corporation of that part of its electric railway system in Oneonta, starting in Main Street and running through Broad to the east end, and from Chestnut and Main Streets east in Main Street and Broadway to Market Street. There was no opposition to the proposed abandonment.

Improvement in Net Earnings.—The gross earnings of the East Penn Electric Company for the year ended Aug. 31, 1923, were \$2,798,350, against \$2,262,135 for the same period a year ago. The net earnings were \$1,006,129 and for the year ended August a year ago were \$859,737.

Net Income Increases.—The gross earnings of the Twin City Rapid Transit Company, Minneapolis, Minn., were \$10,210,795 for the nine months ended Sept. 30, 1923, against \$10,251,795 for the same period a year ago. The net income after the consideration of fixed charges, etc., amounted to \$1,151,755 against \$1,044,509 for the nine months ended Sept. 30, 1922.

Traffic and Transportation

Ten-Cent Fare Asked in Kingston

The Kingston Consolidated Railroad, Kingston, N. Y., has applied to the Public Service Commission for permission to charge a 10-cent cash fare in Kingston with a ticket fare of 8 cents. The present fare rate is 7 cents.

The railroad operated on a 5-cent fare until April 15, 1919, when a 6-cent fare was authorized. The company later sought to abandon certain parts of its lines in Kingston, but this step was put off and an agreement reached whereby a 7-cent fare was placed in operation on Dec. 23, 1920.

The company in its petition to the Public Service Commission states that in 1921 certain economies were put into effect which produced a saving over 1920 of \$10,000. Since 1921 these savings have gradually diminished because of wage increases and other expenses, so that by 1924 the savings will be wiped out entirely.

The revenues received from its railroad at the present passenger rate are gradually diminishing, accounted for by the increased use of automobile and bus operations and other causes, so much so that the return upon the capital invested is not sufficient and will not allow the petitioner to add to and improve its railroad property or to keep pace with the growth and development necessary and meet the requirements of the territory served.

The company in a supporting petition shows that for the first nine months of 1923 its total revenue from street railroad transportation was \$169,213. The total operating expenses were \$129,026 and its taxes \$11,367.

Fare Increase Sought by Texas Electric

The Texas Electric Railway, which owns and operates the lines in Sherman and Denison, Tex., has asked authority of the City Commissions in both cities to increase fares on the grounds that the present fares cannot permit the company to operate at a profit. Authority is sought to increase fares from 5 cents to 7 cents for regular cash fares and to sell four tickets for 25 cents, or a fare of 6½ cents where tickets are purchased. The fare for children and students in schools would be 3½ cents. Jack Beall, president of the Texas Electric Railway, and James P. Griffin, vice-president and general passenger agent, both of Dallas, visited the two cities and placed the matter before the City Commissions.

Messrs. Beall and Griffin told the City Commissions that the gradual increase in the number and use of automobiles had brought about a gradual reduction in passenger revenues of the

companies operating in Texas, and that the situation had reached a point where relief must be given if the traction companies are to maintain the high standard they have maintained in the past.

Applications for similar increases are pending in Waco and Corsicana.

Action Taken Against Jitneys

All jitneys are off Federal Street in Youngstown as a result of the Council's latest anti-jitney ordinance. The ordinance moving the jitneys west of the postoffice also was put into effect. The west-bound jitneys that formerly parked in West Federal Street now are stationed in Chestnut Street. City Solicitor Leighninger, at the order of the Council, is now drawing up an ordinance to be presented shortly that will prohibit the jitneys from entering the congested district.

Prior to this order the jitney controversy in Youngstown had been renewed when Safety Director Hamilton ordered the police to enforce sections of the jitney ordinance restricting the discharging of passengers in downtown streets. As a result J. H. Hogan, representing South Side jitney men, countered with a demand that the city cease discrimination in traffic enforcement, pointing out to Hamilton that the Pennsylvania-Ohio buses were violating traffic laws in parking in East Boardman Street. The jitney ordinance passed by the City Council on Oct. 8 provided among other restrictions that jitneys entering or leaving the city by Market Street should load and unload on Front Street between Market and Phelps. Mr. Hamilton said that he had ordered the police to enforce every traffic ordinance to the limit and that if the Pennsylvania-Ohio buses were still violating the law the drivers of them would be treated the same as others.

Six-Cent Fare in Cleveland

Car riders of the Cleveland Railway on Dec. 1 started to pay a 6-cent fare with a penny charge for transfer. Nine tickets were sold for 50 cents. This is the second street car fare raise in Cleveland within two months. The last raise went into effect on Sept. 1, when the sale of eleven tickets for 50 cents was discontinued.

The increased rate of fare is due to the fact that the company's interest fund now shows a deficit of \$83,801.54. Originally placed at \$500,000, the company's franchise provides that the fare goes up when this fund drops below \$300,000 and the fare goes down when the fund goes above \$700,000. The 6-cent fare is the highest permitted by the franchise.

The increased rate of fare is due to the big deficits that were accumulated during the period when Clevelanders were riding for a nickel, officials of the Cleveland Railway say.

Fare Increase Denied.—The Oklahoma Corporation Commission has denied the application of the Tulsa Street Railway to increase its fare from 7 cents to 8 cents. The Tulsa property has been struggling against jitney operation for several years and in order to meet this competition extended its service some months ago by putting on buses to be operated in connection with the city lines. In its application the company says that the operation of these buses contributed to a heavy loss sustained during the past year. The commission held that losses due to operation of motor buses in connection with a city street railway system would not be considered in determining the proper railway fare.

Will Seek Fare Adjustment.—University of Washington students, represented by a committee appointed by President Sam Mullins of the Associated Students, will appear before the City Council of Seattle shortly to ask for a 2½-cent carfare, with transfer privilege, the same as is accorded to high school students. The matter has already been taken up privately with several members of the City Council.

Reproduced in San Diego Electric Railway "Pass One" to Show the Contrast with Commodious Equipment of Present Day

Abide by Ordinance.—Jitney operators of Shreveport, La., at first threatened to cease operating altogether as a result of a regulatory ordinance passed by the city. The ordinance requires the jitneys to operate continuously from 7 a.m. to 7 p.m. along certain specified routes and on a regular schedule. There are probably fifty jitneys operating in Shreveport and they haul an average of 5,000 passengers daily. After stopping their cars for a short time, the operators resumed service and are obeying the ordinance.

Bus Plan Approved.—The City Council of Toledo has approved the Community Traction Company's plan for motor bus operation. The ordinance which was recently sanctioned provides for the purchase of two modern buses on the Oak Street extension to replace the two machines now being operated in conjunction with the traction system, but on a rental basis. Another bus is being rented and operated on South Erie Street, and this, it is expected, will be replaced by a company-owned motor bus. Arrangements include financing by an addition to the preferred stock.

Accommodates School Children.—Unusual service is being given by the recently started Melrose addition feeder bus line of the Springfield Railway, Springfield, Ohio, in that the bus is diverted twice each day from its regular route in order to carry school children directly to and from the Highland School, about a mile distant. The plan was adopted after being suggested to residents by P. E. O'Brien, general manager of the railway. Twenty-six children are carried daily in the bus at a round trip fare of 3 cents each.

Opera Service on North Shore Line.—With the opening of the opera season recently by the Chicago Civic Opera Association, the Chicago, North Shore & Milwaukee Railroad started a special train service to accommodate opera patrons living in the near North Shore towns. This special train service consists of a dining car and coach. It leaves Great Lakes at 6:32 p.m. and arrives at Congress and Wabash, at the door of the Auditorium, Chicago, at 7:50 p.m. The "Civic Opera Special," as it is called, makes express stops in the intervening towns between Great Lakes, 34 miles north of Chicago, and Chicago.

Better Transportation This Winter.—H. G. Tulley, president of the International Railway, Buffalo, in referring to the new snow equipment for the coming winter said that in the winter of 1922-23 the cars were operated by new men who, while trained operators, were unfamiliar with the severe weather encountered in that part of the country. The organization was now a year old and, benefiting by the experience of last season, was expected to provide better winter transportation this year. It was pointed out by President Tulley that most of the cold weather delays are caused by stalled automobiles, trucks and other vehicles blocking the tracks, often interfering so greatly with the

operation of plows and sweepers, as to permit the storm to gain headway and become unmanageable. City co-operation in keeping the tracks free from obstruction, and in strictly enforcing traffic regulations, would do much, Mr. Tulley said, to insure regularity of service and elimination of delays.

Safety Meetings Held.—The Los Angeles Railway has started a series of safety meetings in which officials of the company meet trainmen at the five car-house divisions. One general topic is discussed at each division in five consecutive weeks. Attendance is voluntary on the part of trainmen, but attendance records are kept and are of use in selecting trainmen for the special Christmas bonus under the merit and bonus system of the company. In the first series of meetings C. M. McRoberts, general claim agent, and John C. Collins, supervisor of safety, have paved the way for future safety meetings by arousing the interest of trainmen in the cause.

Large Sum for Transporting Mail.—During the last fiscal year \$604,915 was expended by the Post Office Department for the transportation of mail by electric railways. At the close of the fiscal year authorizations were in effect over 8,521 miles of electric railway. This included service on 317 routes. During the full twelve months 10,883,970 unit miles were traveled. The average cost per mile was 5.24. Compared with the previous fiscal year, the decrease in the number of routes was eleven. The length of routes increased 162 miles. The decrease in the annual travel was 48,799 unit miles. The increase in the expenditure was \$12,142, and the increase in cost per unit mile traveled was 0.14 cents.

Working for More Pass Riders.—Sales of weekly passes by the Tacoma Railway & Power Company, Tacoma, Wash., for the week beginning Nov. 12, totaled 12,550, a new high record since the pass system was adopted in July, 1922. A recent innovation in its campaign to make the pass more popular was made by the company with appointment of C. J. Quill to the position of transportation salesman. He has been working among operators of the cars, and the system has already shown results. C. V. Allen, advertising manager, states that unless the pass sales can be brought up to 15,000 weekly the company will have to sell the passes for more than \$1 each. The company has for its objective the 15,000 mark. At the present number, the passes are not paying, although 43 per cent more passengers are being carried than before the pass was adopted.

Complaint Sustained.—On the complaint of George Bullock, receiver of the Buffalo & Lake Erie Traction Company, the Public Service Commission has ordered R. H. Henneous to desist from operating a motor vehicle freight line between Erie and North East, Pa., until he receives a certificate of approval.

Legal Notes

ILLINOIS—Policy of Public Utilities Act Stated.

The policy of the Public Utilities Act is not to promote competition between common carriers as a means of providing service to the public, but that through regulation of an established carrier occupying a given field, and protecting it from competition, it may be able to serve the public more efficiently and at a more reasonable rate than would be the case if other competing lines were authorized to serve the public in the same territory. To warrant the Commerce Commission in granting a bus company authority to operate its lines and to serve the same public already served by an existing street railway system it must appear that the railway was not rendering adequate and convenient service, and that the operation of the bus lines would eliminate such inadequacy and inconvenience, the convenience and necessity of the public being a primary consideration. The fact that a bus company is limited to a 5-cent fare, and the street railway company serving the same district is charging a larger fare, does not of itself warrant an order by the Commerce Commission allowing the bus company to operate in such district; nor is the convenience or inconvenience of even a considerable number of individuals the test for an order of convenience and necessity. [West Suburban Transp. Co. vs. Chicago & W. T. Ry. Co., 140 Northeast Rep., 56.]

FEDERAL COURTS—Eviction of Colored Interstate Passenger Justified Only By Proof of Existence of Reasonable Segregation Regulation.

To justify the eviction of a colored interstate passenger for his refusal to occupy a seat in that part of an interurban electric car set apart for colored passengers, it is incumbent on the carrier to show that it had in force a regulation requiring the segregation on its trains of white and colored passengers and that such regulation was reasonable. Oral instructions by a carrier to its conductors to segregate interstate passengers by races is not a valid regulation binding on the passengers, since knowledge of such regulation should be brought home to the passenger at least constructively before he enters the car. [Washington, B. & A. Electric R. Co. vs. Waller, 289 Federal Rep., 598.]

NEW YORK—Duties and Rights During a Strike Defined.

An attempt of city officials to prevent a street railway company from taking out of its barns or operating any of its street cars during a strike of its employees, on the ground that it is to preserve law and order, will be enjoined. It is the duty of the police and department of public safety to preserve order and protect the property of citizens, individual and corporate, and it is their duty to protect a street railway

company in running its cars during a strike of its employees. The right of any man to work, if he wants to, is as inalienable a right as the right of another to quit work, and no person has a right to prevent another from working when he wants to. [Schenectady Ry. Co. vs. Whitmayer, Mayor, et al., 199 New York Suppl., 827.]

FEDERAL COURTS: Rights of Lessor, Lessee and Creditor.

Where a receiver for a lessee defaults in rental under the lease, further operation of the railway property by the receiver is considered to be with the acquiescence of the lessor, and is for its account and at its risk. The relations between the two will not be affected by the fact that the officers are the same or the same person is the receiver, and a street railway company, which furnished power, maintenance and repairs to the lessee of another system, necessary to keep it in operation, has an equitable lien on the earnings of such system until it is paid, and a receiver for the lessee is justified in paying from earnings bills for power, etc., furnished prior to the receivership. While a materials creditor furnishing supplies necessary to the operation of the railway has an equitable lien therefore, on the current earnings, the receiver is obliged to pay for the same only to the extent of his ability. [Westinghouse E. & M. Co. vs. Brooklyn Rapid Transit Co., et al., 291 Federal Rep., 836.]

MICHIGAN—Duty of Motorman to Slow Down When Signaled.

Where a truck became stalled on the crossing of an interurban line at night and an attempt was made to stop an approaching interurban car by waving a lantern, because a curve hid a view of the obstruction from the motorman, it was his duty to slow down sufficiently that he could stop if exigencies required, though the light was white, and such as was sometimes used by intending passengers in attempting to stop the car at a place where it did not stop. Hence evidence of motorman's failure to slow down was a question for the jury as to negligence. [Vernick vs. Detroit, M. & T. S. L. Ry., 194 Northwest. Rep., 992.]

FEDERAL COURTS—Proceeds of Tax Refund Not a Trust Under an Adjustment mortgage.

Where a street railway company had issued adjustment mortgage bonds entitled to receive stipulated interest payments only from the net income of the company, with express provision it should be non-cumulative, a refund to the receiver of the company of excess taxes collected during three previous years, in none of which the full amount of interest on the bonds had been paid, was not a trust fund in the hands of the receiver for payment of additional interest for those years. [American Brake Shoe & Foundry Co. vs. New York Rys. Co., et al., 291 Federal Rep. 112.]

Personal Items

M. R. Boylan Acting General Manager

Public Service Railway Announces Changes in Personnel Affecting Department Heads

A number of changes have been announced in the personnel of the Public Service Railway, Newark, N. J., effective on Dec. 1. They follow:

M. R. Boylan, who has been general auditor, becomes acting general manager during the absence of R. E. Danforth, who starts Dec. 1 on a vacation of four months.

A. T. Warner, traffic engineer, becomes assistant to the acting general manager.

P. W. Pierson, executive assistant, becomes assistant to the acting general manager.

M. R. Boylan

L. P. Baurhenn, formerly assistant general superintendent, becomes general superintendent.

W. H. Shepard, for a long time assistant superintendent of time-tables, becomes assistant general superintendent.

Newton W. Bolen, general superintendent, becomes special representative of the company in Hudson County.

H. C. Donecker, assistant general manager, becomes assistant to Vice-President Edmund W. Wakelee.

Mr. Boylan is a native of New Jersey. His service with the Public Service Railway and its subsidiaries dates back to 1892. That is a long while. Matt Boylan just before that had qualified at school as a stenographer and secretary and it was in these capacities that he served in the office of C. B. Thurston, president of the Jersey City & Bergen Railroad, then a horse car line. During the next few years the Jersey City system was electrified and Mr. Boylan went from his clerical position through the transpor-

tation department, the shops and the power generating stations.

All this sounds natural enough in the line of progress, but not everybody grows, not everybody progresses. The advance of years has ripened his judgment and steeled his determination. Matt Boylan can decide things for himself. And having decided them he can see them through.

But to get back to Mr. Boylan's career with the railway. Things had been happening outside of the company while he was learning and earning, and the upshot of them was that the Jersey City & Bergen Railroad was absorbed by the Consolidated Traction Company and the latter leased to the North Jersey Street Railway. Some there are who would have seen their chances fade with a change of this kind, but to Mr. Boylan it meant greater opportunity with a greater corporation. It meant, too, that he had found himself. He had tried nearly all branches of railway work, and had come to the conclusion that his natural forte was figures. So in 1899 he became voucher clerk in the auditors office. After serving successively as bookkeeper, chief clerk and assistant auditor, he was in 1904 made general auditor of the Public Service Railway, which had acquired the North Jersey Street Railway the previous year. In 1910 he was elected first vice-president of the American Electric Railway Accountants' Association and in 1912 was made secretary-treasurer of the association. In 1916 he became president of the Accountants, serving through 1919.

Mr. Boylan's accession to the managerial staff is a natural one. He knows the company, he knows the men in the service, he knows the public with which the company deals, he is popular personally all over the territory served by the company, his training in accounting has taught him care and he will bring to the problems now before the railway a new and detached point of view.

Mr. Baurhenn, who becomes general superintendent, was formerly assistant general superintendent. Before that he was superintendent of the Bergen division. He joined the Public Service Railway when the company took over the New Jersey & Hudson River Railway & Ferry Company from Ford, Bacon & Davis.

The other men included in the changes have all been connected with the company for considerable periods. Mr. Bolen's term of service dates back to 1903. Before that he had been a division superintendent with the Brooklyn Rapid Transit Company. Mr. Donecker went to the Public Service Railway in 1913 from the post of secretary of the American Electric Rail-

way Association. He has been engaged in street railway work since 1890, both in the operating and manufacturing ends.

Mr. Gaboury Appointed to Safety League

Arthur Gaboury, formerly superintendent of the Montreal Tramways, has been appointed general manager and secretary of the Province of Quebec Safety League. The appointment was announced following the meeting of the executive committee of that organization, held recently under the chairmanship of Zephirin Hebert, president. In appointing him, Mr. Hebert said that Mr. Gaboury had had considerable experience in connection with the safety movement in Montreal and that he considered Mr. Gaboury's selection a very fortunate one.

Mr. Gaboury has been identified with the Montreal Street Railway since 1894, and has been a prominent figure in the railway field ever since. Early in the current year he resigned as superintendent to become vice-president and managing director of the American Druggists Syndicate, Ltd., of Canada. Besides his railway affiliations Mr. Gaboury has given his services for the advancement of French activities, which in 1918 received public recognition from the French government in the form of a title of Officer of the Academy.

Bert C. Wood, for the past five years chief claim agent of the Youngstown Municipal Railway, has recently been appointed general claim agent of the Pennsylvania-Ohio Electric Company and the Youngstown Municipal Railway, Youngstown, Ohio. Mr. Wood has been connected with the above companies for the past fifteen years and previous to that time with the Youngstown Sheet & Tube Company.

F. A. Clark is back again as superintendent of power of the City Light & Traction Company, Sedalia, Mo. As was announced recently in the *ELECTRIC RAILWAY JOURNAL* he was transferred to Washington, Pa., to become a member of the organization which is constructing the new gas plant there. He chose, however, to return to Sedalia.

Matthew C. Carswell, with a record of almost fifty years service, recently resigned from the Interborough Rapid Transit Company, New York, N. Y. He held the position of master carpenter. Since he joined the elevated railway system on June 1, 1878, up to September of this year he served under four general managers, four chief engineers, two engineers maintenance of way and three master carpenters. In 1882 he became foreman carpenter, assistant master carpenter in 1904 and master carpenter in 1908. At a dinner in his honor on the evening of Oct. 17 Mr. Carswell was presented with a traveling bag which it was said "was too small to hold even a part of the affection and esteem his associates had for him."

W. F. Graves Leaves Montreal

He Was Chief Engineer of the Montreal Tramways for More than Nine Years

Willard F. Graves, whose resignation after nine years service as chief engineer of the Montreal Tramways was previously noted in the *ELECTRIC RAILWAY JOURNAL*, began his electric railway career as assistant engineer of construction on the South Side Elevated Railway in Chicago, now a part of the Chicago Elevated Railways System. With that company he had charge of the very extensive reconstruction work involved in building a third or express track from Twelfth Street to Forty-third Street, which included grade, line and station, revision of the old structure, as well as the new track. During the progress of this work the very heavy regular train service was

W. F. Graves

handled by means of temporary tracks and structures.

After that work had been finished Mr. Graves was engaged as superintendent of track, in the reconstruction and maintenance of the tracks of the Chicago City Railway under the 1907 ordinances. During the three years of rehabilitation, as specified in the ordinances, practically the entire track system of 300 miles was rebuilt. This work necessitated at times the employment and organization of between 3,000 and 4,000 men.

From this position he was appointed chief engineer of the Montreal Tramways and engaged in the extensive reconstruction of this property, involving the addition and extension of power houses, substations, tracks, etc., including an extensive system of underground high tension conduits.

While acting as chief engineer of the Montreal property Mr. Graves was engaged to make a track valuation of the Detroit United Railway, and subsequently of the Halifax Tramways & Power Company, Halifax, N. S., and the Quebec Railway, Light, Heat & Power Company, Quebec.

He has been interested for many years in the activities of the American Electric Railway Engineering Association, as a member of the committee on way matters, acting as its chairman during the years 1921-1922 and 1922-1923, and representing the association on several sectional committees of the American Engineering Standards Committee. He is an associate member of the American Society of Civil Engineers, member of the American Railway Engineering Association, Engineering Institute of Canada and the executive committee of the committee on welded rail joints.

Hector Poli has been appointed master carpenter of the elevated lines of the Interborough Rapid Transit Company, New York, N. Y. In this capacity he succeeds Matthew C. Carswell, who resigned recently with a record of approximately fifty years. Mr. Poli entered the employ of the company in 1910 and was promoted to shop foreman in 1913. In 1922 he was made general foreman and became master carpenter on Oct. 1, 1923. In thirteen years he has risen from carpenter to master carpenter.

Obituary

Richard Hapgood

Richard Hapgood, one of the oldest street railway men in the United States in point of service, died recently at his home in Belmont, Mass. He retired in September, 1912, as roadmaster of the Boston Elevated Railway after sixty-four years service. He went to work in 1858 as stableman for the old Union Railway, the original horse car line between Cambridge and Boston. By 1872 he had risen to the position of superintendent of the road, which he held until 1885, when he resigned. A short time later Mr. Hapgood became roadmaster for the Consolidated Street Railway in Boston and later superintendent of the South Boston Railroad. When the latter merged with the West End Street Railway, he remained as superintendent of the South Boston division and was later made superintendent of the Cambridge division. In 1892 Mr. Hapgood became roadmaster of the West End Street Railway and remained in that position when the road was merged with the Boston Elevated Railway.

Henry Pearson, vice-president of the Wason Manufacturing Company, car builders, of Springfield, Mass., died suddenly of heart disease in the car shops Nov. 27 at the age of seventy-one years. Mr. Pearson went to the Wason Manufacturing Company from the Harris-Corliss Engine Works in Providence, R. I., in 1881 to take charge of the machine department. He rose to vice-president and general manager and then to president, holding that office four years, up to 1910, when the plant was taken over by the J. G. Brill Company.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

November Good Month in Copper Market

The copper market came to life during November and more of the metal was sold than for many months. Supplies were adequate to meet the demand, however, though at gradually advancing prices, about 13½ cents being asked at the end of the buying movement. Since then a recession has taken place, and at the end of the month the metal was obtainable at about 13 cents per lb. With the large production now being made in the United States, South America and Africa there seems to be little likelihood of any marked advance in prices, European financial conditions not being such that that continent can buy the copper in the large quantities that it might absorb. On the other hand, prices are now so low that many companies are doing little better than breaking even, so any further important decline may hardly be expected.

Look to the League for Business Hints

Edwin S. Webster, of Stone & Webster, who has just returned from a visit to the League of Nations headquarters, says that he was very much impressed by the amount of information possessed by the league regarding conditions in every country in the world. If one were going into business in any out-of-the-way country he would recommend getting in touch with the league to find out what that body had in the way of information.

Mr. Webster said that one could get accurate information which never before had been made available on almost any country on earth. This is probably a phase of the League of Nations on which many business men generally have not heretofore been well informed.

Winnipeg Property Protects Road at Crossings

The Winnipeg Electric Railway, Winnipeg, Man., has placed orders with the Union Switch & Signal Company for the necessary materials to protect its road against steam trains at four crossings: Notre Dame Avenue, where two of the crossings are involved, one where the Canadian Pacific crosses and the other where both the Midland and Canadian Pacific cross; Academy Road, where two crossings are protected, one crossed by the Midland and Canadian Pacific Railway, and the other by the Canadian National Railway. Light signals, with automatic control, are employed for this protection in all cases except on the Canadian Pacific Railway at Notre

Dame Avenue, where automatics are now in service and style "S" semaphore signals will be used. The field installation will be made by the company's regular forces.

Bituminous Coal Production Increases

The output of bituminous coal in October totaled 49,171,000 tons, as compared with 46,175,000 in September and 45,173,000 for October, 1922. The production of anthracite aggregated 8,724,000 tons, as against 2,917,000 in September and 8,578,000 in October a year ago.

General Electric Buys New Property

The General Electric Company has purchased at Los Angeles, Cal., 5 acres of property on which is now located a two-story reinforced concrete building. This will immediately be modified and converted into a fully equipped service shop in which all kinds of electrical apparatus will be rebuilt and repaired. Later a large warehouse will be built on the property and eventually there will probably be a factory.

Japanese Interests and Westinghouse Combine

An arrangement has been made between the Westinghouse Electric International Company and Japanese electrical interests. The new company is known as the Mitsubishi Denki Kabushiki Kaisha, or, in English, the Mitsubishi Electric Manufacturing Company. It is thought that the capitalization will be 15,000,000 yen, or \$7,500,000, although definite word on this point has not yet been received.

As a result of progress during recent years Japanese electrical development, including railroad electrification, the utilization of water power, the installation of large steam generating plants and the formation of superpower systems, compares favorably today with that in the United States.

As a consequence of this rapid development, electrical apparatus has become one of Japan's largest imports, and since Japan's principal exports, silk, copper and objects of art, can hardly be expanded by a corresponding degree, it was thought that there was some danger of a continuing unfavorable balance of trade. Hence it seemed wise to certain Japanese interests to stimulate the manufacture of electrical machinery and supplies in Japan.

In pursuance of this policy, the Mitsubishi interests, which are engaged in banking, shipbuilding and steel making, approached the Westinghouse company with a proposal for a co-operative agreement whereby the company was to supply technical skill and experience to a Japanese manufacturing company.

ELECTRIC RAILWAY MATERIAL PRICES—NOV. 27, 1923

Metals—New York

Copper, electrolytic, cents per lb.	13.05
Lead, cents per lb.	6.90
Nickel, cents per lb.	29.50
Zinc, cents per lb.	6.75
Tin, Straits, cents per lb.	46.75
Aluminum, 98 to 99 per cent, cents per lb.	25.50
Babbitt metal, warehouse, cents per lb.:	
Fair grade.	52.00
Commercial.	25.00

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads.	\$4.65
Somerset mine run, Boston.	2.375
Pittsburgh mine run, Pittsburgh.	2.00
Franklin, Ill., screenings, Chicago.	1.45
Central, Ill., screenings, Chicago.	1.05
Kansas screenings, Kansas City.	2.00

Track Materials—Pittsburgh

Standard Bessemer steel rails, gross ton.	\$43.00
Standard open hearth rails, gross ton.	43.00
Railroad spikes, drive, Pittsburgh base, cents per lb.	3.15
Tie plates (flat type), cents per lb.	2.575
Angle bars, cents per lb.	2.75
Rail bolts and nuts, Pittsburgh base, cents, lb.	4.125
Steel bars, cents per lb.	2.40
Ties, white oak, Chicago, 6 in. x 8 in. x 8 ft.	\$1.30

Hardware—Pittsburgh

Wire nails, base per keg.	3.00
Sheet iron (28 gage), cents per lb.	3.75
Sheet iron, galvanized (28 gage), cents per lb.	4.85
Galvanized barbed wire, cents per lb.	3.80
Galvanized wire, ordinary, cents per lb.	3.35

Waste—New York

Waste, wool, cents per lb.	15-18
Waste, cotton (100 lb. bale), cents per lb.:	
White.	13-15.50
Colored.	10-15

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), per gal.	\$0.93
White lead (100 lb. keg), cents per lb.	11.375
Turpentine (bbl. lots), per gal.	\$0.93
Car window glass, (single strength), first three brackets, A quality, discount*	84.0%
Car window glass, (single strength), first three brackets, B quality, discount*	86.0%
Car window glass, (double strength) all sizes, A quality, discount*	85.0%
Putty, 100 lb. tins, cents per lb.	4-6

*These prices are f.o.b. works, boxing charges extra.

Wire—New York

Copper wire base, cents per lb.	15.75
Rubber-covered wire, No. 14, per 1,000 ft.	\$6.50
Weatherproof wire base, cents per lb.	16.50

Paving Materials

Paving stone, granite, 4x8x4, f.o.b. Chicago, dressed, per sq. yd.	\$3.60
Common, per sq. yd.	3.20
Wood block paving 3½, 16 treatment, N. Y., per sq. yd.	2.79
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots.	54.00
Crushed stone, ½-in., carload lots, N. Y., per cu. yd.	1.75
Cement, Chicago consumers' net prices, without bags.	2.20
Gravel, ½-in., cu. yd., f. o. b. N. Y.	1.75
Sand, cu. yd., N. Y.	1.25

Old Metals—New York and Chicago

Heavy copper, cents per lb.	10.75
Light copper, cents per lb.	9.25
Heavy brass, cents per lb.	6.00
Zinc, old scrap, cents per lb.	4.125
Yellow brass, cents per lb. (heavy)	5.75
Lead, cents per lb. (heavy)	6.00
Steel car axles, Chicago, net ton.	\$16.75
Old car wheels, Chicago, gross ton.	18.75
Rails (short), Chicago, gross ton.	19.75
Rails, (relaying), Chicago, gross ton.	33.50
Machine turnings, Chicago, net ton.	6.25

Rolling Stock

Michigan United Railways, Jackson, Mich., has sent out inquiries for bids on the construction of six new parlor chair cars which are to be arranged as complete units equipped with baggage and smoking compartments.

Birmingham Railway, Light & Power Company, Birmingham, Ala., has recently purchased four Reo buses to be delivered late in December. They will operate in sections formerly served by the jitneys.

Department of Street Railways, Detroit, recently placed an order for 100 cars. The original order for fifty Peter Witt type cars from the McGuire-Cummings Company was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Nov. 17. This order was later increased to 100 cars and fifty were to be built by the Osgood-Bradley Car Company. This explains the status of the car situation in Detroit which was mentioned in the Nov. 17 and Nov. 24 issues of the paper. The train of three cars which is being built by the Cincinnati Car Company will be delivered about Jan. 1, 1924. This train may be operated by one motorman and three conductors or may be operated by one motorman and one conductor. The one conductor will stand in the middle car, which will be used as an entrance car, and the two end cars will be used as exit cars, there being a passageway between the cars.

Track and Line

Charleston Consolidated Railway Gas & Electric Company, Charleston, S. C., is replacing the double track on King Street with a single-line track.

Grand River Valley Railway, Grand Junction, Col., will build a 3½-mile beet spur into the irrigated country north and west of Fruita, its present terminus. Ultimately the spur will be extended to approximately 12 miles.

Duluth Street Railway is planning to complete the extension to Kenwood next year. This line will be built to St. Marie Street some time next spring. General Manager Warren said that active work would be started as soon as the weather would permit.

United Traction Company, Albany, N. Y., will consider with city officials the proposition of improving Western Avenue from Manning Boulevard west to the Albany city line. It is planned to have the United Traction Company's track on the south side of Western Avenue west of the Manning Boulevard, removed to the center 33-ft. strip of the thoroughfare. The city will then improve the south side of the avenue, lay a new concrete pavement to correspond with the one on the north side and build new sidewalks. It is believed that the United Traction Company will deed to the city the land which is now unused and which consti-

tutes the middle 33 feet of the avenue. If this happens the city will pay all, or a part of the cost of relaying the track.

Springfield, Mass.—The joint committee of Springfield and West Springfield, Mass., on a new bridge across the Connecticut River to replace the bridge burned last September has agreed upon plans for an open-deck steel bridge to cost \$873,000, the structure to be 1,135 ft. long and 70 ft. wide, with 54-ft. roadway and 8-ft. sidewalk on each side. Estimates call for \$56,000 for electric railway tracks, including metal to carry the wheel base, of which sum \$25,000 is to be assessed on the Springfield Street Railway, this expenditure being in addition to the \$873,000. A verbal agreement has been made between the street railway company and the city, by which the company would pay the city an annual rental estimated to amount to \$1,500 yearly, payments being computed on the same basis as in the case of the Hampden County Memorial Bridge.

Mississippi Valley Electric Company, Iowa City, Iowa, is adding a short stretch of additional track to the Dodge Street line. The work will cost approximately \$3,500.

Cincinnati, Ohio.—Extension of Cincinnati's rapid transit loop 4 miles was decided on at a recent meeting of the Board of Rapid Transit Commissioners, when a resolution was adopted to appropriate the property lying between Mitchell and Section Avenues, Norwood. Under the revised plans, the loop will terminate in Oakley, instead of in Avondale. The extension will follow the bed of the old canal and then proceed to Oakley by way of St. Bernard, Carthage and Norwood. Most of the work will be open construction, Frank Raschig, rapid transit engineer, announced, except where the route of the subway intersects railroads or streets. No additional bond issue is necessary for this phase of the work. The commission definitely stated that the money on hand would enable it to construct the subway as far as Oakley.

Power Houses, Shops and Buildings

Jamestown, N. Y.—Owing to the fact that cars of the Jamestown Street Railway, Chautauqua Traction Company and the Jamestown, Westfield & Northwestern Railway are now running entirely on Niagara power the old power house at Jamestown having been dismantled. The equipment to be sold includes nine boilers, four turbines, pumps, condensers, switchboards and other auxiliary machinery.

United Railways, St. Louis has recently added a new bay to the car-building department of the general shops. The addition is constructed along the most modern lines, having steel framing and brick walls, and is made fireproof by the installation of the best fire doors. The new bay has

a capacity for holding twenty-four cars while under construction. Situated between the car-building shop and the truck and blacksmith shops is the transfer table. This device is operated when transferring cars from department to department while they are in various stages of construction.

Puget Sound Power & Light Company, Seattle, Wash., announces that tentative plans are under way for a terminal at the corner of Elk and Magnolia Streets in Bellingham to cost \$200,000. The terminal is to serve the company's traction trains and stage lines terminating in Bellingham. The proposed structure will be three stories high, with full basement, 150x125 ft.

Trade Notes

The Texas Company, New York, N. Y., producers of Texaco Petroleum Products, has just renewed a contract for the supply of lubricants to the Boston Elevated Railway, Boston. This is the third consecutive year that the Texas Company has obtained this business, one of the largest electric railway lubrication contracts of the country.

Conveyors Corporation of America, Chicago, announces that Jay C. Lathrop, its Cincinnati district representative, has removed his office to 503 Neave Building, Cincinnati.

General Electric Company, Schenectady, N. Y., has appointed L. R. Brown manager of the transformer division of the new central station department. He was one of the company's first transformer specialists and has a wide personal acquaintance in the central station industry. In connection with the reorganization following this and other changes in the central station department, G. G. Jeter, H. F. McRell and Clinton Jones are to be sales managers in this division. Mr. Jeter will have charge of transformer accessories, advertising and publicity; Mr. Jones will have supervision of power transformers, and Mr. McRell, distribution transformers.

New Advertising Literature

The Johns-Pratt Company, Hartford, Conn., has issued the second edition booklet of the Noark universal service switches.

International Western Electric Company, New York, N. Y., has issued the latest edition of "Electrical Communication." It is a 150-page booklet containing such articles as Telephone Transmission Over Long Distances, Recent Developments in Telephone Equipment for Train Dispatching Circuit, Telephone Traffic Control for Tramways and other instructive reviews.

MacGovern & Company, Inc., New York, N. Y., has issued a twenty-four-page booklet dated November, 1923, and entitled "Power Machinery—Electrical, Hydraulic, Steam, Gas."

New York, Saturday, December 8, 1923

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Published by McGraw-Hill Company, Inc.

HENRY W. BLAKE and HARRY L. BROWN, Editors

The Editorial of the Day

A PLAN (for the reduction of taxes) has been presented in detail in a statement by the Secretary of the Treasury which has my unqualified approval. . . . Diminishing charges against moderate incomes from investment will afford immense relief, while a revision of the surtaxes will not only provide additional money for capital investment, thus stimulating industry and employing more labor, but will not greatly reduce the revenue from that source, and may in the future actually increase it.

"Being opposed to war taxes in time of peace, I am not in favor of excess-profits taxes. A very great service could be rendered through immediate enactment of legislation relieving the people of some of the burden of taxation. . . .

"The taxes of the nation must be reduced as much as prudence will permit, and expenditures must be reduced accordingly. High taxes reach everywhere and burden everybody. They bear most heavily upon the poor. They diminish industry and commerce. They make agriculture unprofitable. They are a charge on every necessary of life. Of all services which Congress can render to the country, I have no hesitation in declaring this one to be paramount. To neglect it, to postpone it, to obstruct it by unsound proposals, is to become unworthy of public confidence and untrue to public trust. The country wants this measure to have the right of way over all others.

"Another reform which is urgent in our fiscal system is the abolition of the right to issue tax-exempt securities. The existing system not only permits a large amount of the wealth of the nation to escape its just burden but acts as a continual stimulant to municipal extravagance. This should be prohibited by constitutional amendment. All the wealth of the nation ought to contribute its fair share to the expenses of the nation."—THE PRESIDENT.

Shall we not actively support this program?

Valuation Differences in Terms of Fares or Economies

IT FREQUENTLY occurs that municipal authorities and railway officials are unable to agree on a valuation of the property for rate-making purposes, and all progress of a managerial nature is blocked pending settlement. The question is raised whether this failure to come to a settlement figure is not often quite unjustified in the light of what the difference would mean in terms of increased rate of fare, from the standpoint of the city, or as measured in terms of economies or better earnings that may be held in abeyance, from the standpoint of the company.

For example, in one city recently the company held out persistently for a value about \$1,500,000 higher than the city would concede, the city's figure being about \$6,500,000 total. Yet with this mooted valuation settled, the company would be in a position to make operating improvements, as recommended by an outside expert, resulting in more than \$500,000 increase in the net, annually. This increase alone would carry at 7 per cent a capitalization of \$7,000,000—as much as the entire value of the property. Under such circumstances, a million or so difference between the value asked and the value obtainable would hardly seem worthy of being permitted to delay the possible improvements.

Similarly, the importance of the controversial difference dwindles in many cases when translated into the rate of fare required to support the higher figure of value. A difference which in itself seems like a huge sum may make a fraction of a cent too small for cognizance in the rate of fare especially on a large system—an amount which might easily be wiped out (or doubled) in a year of good (or bad) operation.

This paper is strongly of the opinion that if about 25 per cent of what is spent on valuation studies and litigation were spent instead in operating studies, the industry would make much more rapid progress. What is needed is more talent directed to transportation efficiency, and greater use of the yardstick method and common sense valuation procedure.

Are Improved Transportation Conditions Approaching in New York?

IF THE early future is to see a greater spirit of co-operation toward the New York City traction properties by the present city administration it will be welcome news for every one, particularly the traveling public. That such a condition is among the possibilities is indicated by recent remarks of acting Mayor Hulbert to the effect that the City Board of Estimate is now "working with the Transit Commission in harmonious co-operation for some real results in the way of a solution of the traffic problem." After all, results are what count in the long run in political as well as in business circles. Ability to scold may bring popularity for a time, but even picturesque invective gets monotonous. Unless a politician can get the people what they want his power is sure to wane.

Just at present the people of New York need more and better transportation more than almost anything else, and the only way it can be had to any material degree is through the existing transportation companies. It is wonderful what they have been able to do in the circumstances, but it is obvious that with fewer obstructions and better credit they could accomplish much more. Not all of the difficulties have come, of course, from the city government, but with that sympathetic and anxious

to help, a better condition is certainly possible. New subways are needed, but while these are in the building it is practicable to increase the present transportation facilities, both rapid transit and surface. With the Brooklyn system reorganized and the reorganization of the New York Railways nearing completion, all of the companies are in a position to do their share in supplying the public need.

Of course the question of return is fundamental. Without an adequate fare all the companies will be greatly handicapped. Nevertheless it should be remembered that while the carfare in New York nominally is 5 cents, virtually it is more than this on both surface and rapid transit lines. On the rapid transit lines passengers get benefit from the fact that no interest is being paid on the city investment under the dual contract, while on the surface lines the average length of ride for a single fare has been reduced by the dissolution of holding companies and the consequent charge of an extra fare, and also by the 2-cent transfer charge. It should also be remembered that the surface lines do not have to carry the long distance riders, as in most other cities, as these go to the rapid transit lines. Perhaps the greatest handicap of the surface lines is slow speed, caused by street congestion, because their average receipts per car-mile compare favorably in amount with those of surface lines in other cities. Here is one way in which the city can help through the passage of more stringent anti-parking ordinances.

If the time has come when the New York City fathers are beginning to realize that a constructive transportation policy is good politics, the public has much to be thankful for.

A Billion Passengers on the Buses

REFERRING to an editorial in last week's issue of this paper, several readers have promptly called attention to the fact that to say buses in 1922 carried only 11,000,000 passengers was wrong—and it was. The figure quoted from the compilation of the Census Bureau was for passengers carried by buses operated by electric railways only—a qualification which was not noted. For all buses, it is probable, based on rough estimates, as no accurate figures are compiled, that the total passengers carried in 1923 will be up toward a billion—something less than 8 per cent of the number of revenue passengers carried on the electric railways of the country during the twelve months ended June 30, 1922.

While this is very different from the obviously erroneous figure used last week, nevertheless, by correcting figures all the way through, the editorial might still be permitted to stand. Its object was to point out the relatively very much greater importance of the electric railway to the public than the bus. The correct figures still show this, though they give to the bus industry a far better position of importance.

It was not the desire of this paper to belittle the bus, for readers know how the JOURNAL has urged its use in its place by the electric railways. But it was thought worth while to show the relative positions of bus and railway. The bus, being new and introducing many new problems and much speculation as to the future of transportation, is really talked of and read of, rather naturally, out of proportion to its present importance as measured by the traffic handled.

Customer Ownership of Utility Securities— From the Customer's Standpoint

THE advantages of customer ownership of utility securities—from the utility standpoint—have been set forth at various utility conventions during the last few years. Naturally, they present the subject from the standpoint of the utility, particularly the improved public relations which it is hoped will be secured by the plan. The position is put forth that if a man—or woman—becomes a security holder in the local utility, the latter thereby obtains a friend, whose sympathy can be counted upon and whose self-interest will encourage him to defend the company against unreasonable demands and unjust attacks. Broadly speaking, this is the main argument put forward for the plan from the utility side. It is interesting to read in the last issue of *The Magazine of Wall Street* an article which brings out other phases of the subject, particularly from the customer's point of view. This perhaps is a phase not often considered.

The magazine article expresses approval of the plan, where the utility is fundamentally a sound one and the stock is worth the amount charged for it. In the first place, it gives opportunity to the local investor to put limited sums in high grade securities of a concern in his home town where he can watch his money, at least to some extent. In this way it will help to counteract the fake-security salesman, educate the community up to the exercise of judgment in the investment field and thus be of constructive benefit to the country as a whole. Referring to this advantage, the paper says: "If consumer financing had nothing whatever to commend it beyond the single capacity toward interesting the general public in high grade, rather than low grade securities, this feature alone would more than justify it and seal it with the stamp of universal approval."

The magazine points out, however, that customer financing doubles the company's responsibility to its customers. It is responsible to them not only for service, but becomes, in effect, a trustee of their invested funds. This emphasizes the need of keeping faith with the customer security holder, giving him a voice in the company councils and letting him know from time to time the exact financial condition of the company. The fact that by his dividends he can pay in whole or in part for his service does not discharge all of the debt which the company owes to the customer who purchases its stock. He could do that by investing the same amount of money in any responsible concern, paying equal dividends.

This trustee responsibility rests upon any company which actively exploits its securities, especially toward those who may be induced to become purchasers to an extent out of proportion to their means. Such holders are in a different position than business men who are accustomed to occasional losses, and the utility must guard very zealously its ability always to pay the promised dividends, lest there come a kind of public relations not sought.

When the principles recommended by D. L. Turner, page 963, for financing rapid transit are accepted, we may look for much needed new construction. His allotment of the cost would be fair and not burdensome to any one, in the light of the return on the individual investment, and it would enable such service to pay its own way on a fare comparable with street railway fares.

Proposed Plan for Financing Detroit Rapid Transit Lines

Engineer's Report Favors Assessment of Construction Costs Against Taxpayers and Benefited Property Owners—Equipment Cost Only, or One-third of the Total, to Be Financed by Bond Issue—Combination Tunnel and Subway Proposed—Piecemeal Construction of Rapid Transit Has Serious Drawbacks

A NOVEL plan for financing new rapid transit lines is the outstanding feature of the report to the Rapid Transit Commission of Detroit by Daniel L. Turner, consulting engineer, and John P. Hallihan, engineer in charge. The report, whose legal features have the approval of P. J. M. Hally, special counsel for the commission, has been transmitted to Mayor Frank E. Doremus for his consideration.

According to the commission's letter of transmittal, the report proposes a pay-as-you-go plan that spreads the cost by assessment over the benefited property and the city at large, leaving only the equipment, which is about 32 per cent of the total investment, to be provided by a bond issue. In this way a large amount of interest will be saved, and the use of bonds based upon the faith and credit of the city will be practically eliminated.

No detailed plan of routes has been presented in the report of the engineers, as they state the location of lines will depend to a considerable extent on the choice of system, which in turn will be determined by the amount of money the city is willing to make available. A combination of subway and tunnel, termed a "tunnelway" by the engineers, is recommended as the most desirable construction if the city is willing to pay the price. A short abstract of the report follows:

A NEW METHOD OF FINANCING ESSENTIAL ON ACCOUNT OF COST

The cost of the proposed rapid transit system for Detroit is such as to indicate at the outset that the city must find some new method of financing a rapid transit program, otherwise it will be impracticable to go forward with it. Under the circumstances, therefore, it is essential that a financial plan should be evolved before a physical plan is announced. A plan of routes can serve no useful purpose, if the money to carry it out cannot be available. In fact, making public such a plan would cause a premature speculation in real estate along the proposed routes with no justification for it whatever.

The routes of the initial rapid transit system for Detroit are dependent, to some extent, upon the type of structure. An underground system may be constructed along any street without injuring it. Elevated lines should be confined to the outlying sections of the city, but if such construction must be carried through the business center, the principal thoroughfares should be avoided and less important streets traversed.

Developing rapid transit piecemeal is very objectionable from the community standpoint. A comprehensive system of rapid transit lines is essential. There should be crosstown lines and up and down town lines articulated together by transfer stations so as to provide for a

convenient circulation and distribution of the traffic throughout the city, thus furnishing a large part of the city with a measure of rapid transit service at the outset, and thereby maintaining the equilibrium of the population distribution.

The building of a single rapid transit line at first, and then another single line, and so on, until finally a rapid transit system is produced, completely upsets the population equilibrium. The first line built acts as a magnet to the population and to business. Congestion of all kinds is produced and the line itself quickly becomes saturated with traffic. This causes an immediate demand for relief along the first line before new lines in new territory can be constructed. Traffic conditions then become so unbalanced at the start that it is difficult ever to catch up.

The initial rapid transit system must be constructed of either subways, tunnels or elevated lines, or a combination of them. Because it must traverse built-up sections of the city, other types, such as surface and depressed lines, cannot be utilized on account of the lack of a suitable right-of-way.

Subways are most popular with the public, as they do not disfigure the streets nor interfere with light, air and access to abutting property, are not open to the weather, and are conveniently accessible to passengers. Because they are shallow underground lines they cannot be constructed without taking up the street surface and rearranging the subsurface structures. Their chief disadvantage is their high cost of construction when compared with elevated lines.

Ordinarily, land tunnels must be located deep enough underground to permit their construction without disturbing the street surface, and stations are not conveniently accessible. Deep level lines have been employed chiefly in London, where the clay underlying the city is most favorable to their construction.

Except for the inaccessibility of the stations, tunnels have all the advantages of subways. If tunnel lines can be constructed as cheaply as subways and have their stations brought to the surface, there can be no difference of opinion as to their desirability, as the tunnel can be constructed with a minimum of interference with streets and with business.

Subsoil conditions in Detroit are almost ideal for tunneling, and the so-called Detroit clay permits a very low cost of construction. A type of underground line can be built that would include the desirable features of both tunnel and subway. This is the construction termed by the engineers a "tunnelway."

Tunnelways will be constructed just below the surface only at the stations, and the streets will be excavated up to the streets at such points. Between stations they will be constructed in tunnels, one for each track. This

means that interference with business during the construction period will be reduced to about 30 per cent of what it would be if a subway were built. The stations will be located at the summits of the profile, so that the trains will have the assistance of the grades in starting and stopping.

At present prices of labor and material it would not be possible to construct and operate a tunnelway system at anything like a 5-cent fare. In this connection it should be pointed out that in New York 61 per cent of the entire rapid-transit system is elevated, or some 125 miles out of 200. Even the so-called subway division of the Interborough Rapid Transit Company—a city-owned subway system—includes elevated lines to the extent of 40 per cent, and the total city-owned systems in New York have 39 per cent of all lines elevated.

In Chicago there are no subway lines. In Philadelphia the entire existing rapid-transit system consists of less than 14 miles of line, and about 85 per cent of this is elevated. In Boston the rapid-transit system, as now operated, is about 16 miles long, and 63 per cent of it is elevated.

To obtain a cheap fare, when the rider must pay the entire cost, a cheap system is necessary. To have a tunnelway system supported by the car rider a 10-cent fare, or more, would be necessary for a number of years.

TUNNELWAYS COST ABOUT ONE-THIRD MORE THAN ELEVATED

Until the financial plan has been decided upon and the extent of the system determined, only costs per mile of route can be given. Detroit must pay the cost of both the construction and the equipment of the system. Such costs at present prices are approximately, for an elevated system, \$3,500,000 per mile, and for a tunnelway system, \$4,700,000 per mile, including all overhead charges.

The tunnelway system consists exclusively of tunnelway lines. The elevated system is mostly elevated, but includes a minimum amount of tunnelway line through the business center. Detroit can have a tunnelway system, says the report, if it wants to pay the price. Otherwise it must accept an elevated system, with all the disadvantages that such a system means to a city.

RAPID TRANSIT SHOULD BE FINANCED UNDER AN ASSESSMENT PLAN

The rapid transit cost should be divided and distributed according to the three benefits derived:

The general benefit to the city at large;

The special benefit that accrues to the property in the vicinity of the lines; and

The obvious benefit to the rider.

Based upon an analysis of the financial condition of the city by the Detroit Bureau of Governmental Research, and from other information available, it is doubtful if the city can now issue bonds in excess of \$30,000,000 for all purposes, states the report. Because of the city's many needs only a very small part of this amount can be used for rapid transit purposes. Consequently, it is very plain that on the basis of the usual plan of utilizing city credit the city is in no position to embark on a rapid transit program requiring the expenditure of any substantial sum that a reasonably adequate rapid transit system would make necessary, even if the cheapest type of construction is adopted. The city cannot turn to private capital for assistance. This would require a reversal of the existing public

policy and would make it difficult to unify the old system and the new.

All the money for construction must be available for use as required during the construction period. Any financial plan to be effective must accomplish this. The total rapid transit cost of one mile of tunnelway should be distributed in accordance with the foregoing benefits as follows:

	Cost per Mile of Double-Track Tunnelway	Per Cent of Total
By at-large assessment on the city, to cover benefits derived by the city at large, for one-fourth of the permanent way cost...	\$800,000	17
By proximity assessment on the local district, to cover benefits that accrue to the property in the vicinity of the lines, for three-fourths of the permanent way cost.	2,400,000	51
By mortgage bonds, to cover the benefits to the rider, for cost of the equipment...	1,500,000	32
Total	\$4,700,000	100

The permanent way consists of the structure, tracks and stations. The equipment consists of the power stations, transmission, signals, yards, shops and cars.

For the combination of tunnelway and elevated line, the city and benefited property owners would pay for permanent way and real estate \$2,000,000 per mile, or 57 per cent of the total, while the amount raised by mortgage bonds for equipment would remain \$1,500,000, or 43 per cent of the total cost.

ASSESSMENT PLAN IS NOW USED FOR OTHER MUNICIPAL PROJECTS

There is nothing new in the principle of such an assessment plan. The city and benefited property pay for the streets by assessment. The sewers are paid for in the same way. In other places property benefited is also assessed to pay for the parks. And under the Ohio conservancy law the cost for works to prevent flood damages is assessed against the property protected. Assessment to pay for rapid transit does not differ in principle from any of these.

Financing a rapid transit system in this way will mean the adoption of a pay-as-you-go policy, or mean that the present generation will pay for the rapid transit facilities required now. This is as it should be. Future generations will have their rapid transit facilities to pay for in their time. Therefore as little of the cost as is possible should be passed on to the future.

The at-large assessment of the city is to be spread over the total assessed valuation of the city, including land, buildings and personal property, for one-fourth of the cost of constructing the permanent way, or for about 17 per cent of the total cost of the tunnelway, including construction and equipment. There will be no interest or sinking fund charges upon these assessment funds, because they have not been borrowed and therefore will not have to be paid back.

The assessment is to be collected in annual installments distributed equally over the seven-year construction period, and for the tunnelway system, per mile of route per year, will amount to about \$114,300.

The at-large assessment for a tunnelway project would be only about 4.73 cents per \$1,000 of total assessed valuation per year per mile of route, based on the 1923 valuation of Detroit and the inclosed and contiguous areas benefited, including Highland Park, Hamtramck and Springwells. For 10 miles of route the

amount would be 47.3 cents per \$1,000, and even for 50 miles of route the assessment would only be \$2.37 per \$1,000 per year.

This assessment is just like any other taxation, excepting that none of the funds raised by it will be used to pay interest on borrowed money, but instead, all of the funds will be converted directly into a self-supporting asset—in other words, into the city's rapid transit system, that in turn will immediately proceed to enhance the value of the property assessed.

The above figures do not include interest during construction on the permanent way cost, because under the assessment plan no money is borrowed for this purpose. If all the money for the project is raised in the usual way by bond borrowings, then these figures will be increased by \$200,000 and \$100,000 per mile, respectively. In other words the permanent way item of cost will be \$3,400,000 per mile of two-track line instead of \$3,200,000 for the tunnelway project, and \$2,100,000 per mile instead of \$2,000,000 for the combined project.

The proximity assessment on the local district is to be spread over the local districts traversed by the rapid transit lines for approximately one-half mile on each side of the lines. The assessment is to be made on the land value only in proportion to the benefits derived, and for three-fourths of the construction cost of the permanent way, or about one-half of the total cost of the project, including construction and equipment. This assessment also is to be collected in seven annual installments corresponding to the seven years of construction, and for the tunnelway system, per mile of route per year, will amount to about \$343,000.

Not all the land will be benefited alike. The benefit at the stations and along the line will be greatest. It will decrease from this maximum to a minimum at about a half-mile distance from the line on each side. Therefore, the assessments will vary in a corresponding manner with respect to the proximity of the land to the stations and line. To simplify its application the assessment will be distributed over six zones at annual rates per square foot on the land only. The same relative rates will be applied at every station, whether it is located in the center of the city or on the outskirts of the city. The assessment rates are as follows:

Approximate Zone Limits from Stations in Feet	Annual Proximity Assessment Rates, Cents per Sq. Ft.
0-250	7
250-500	6
500-1,150	3.5
1,150-1,800	2.25
1,800-2,450	1.5
2,450-2,640	1

Consider as an example that the depth of the average lot is 120 ft. Assume that the lot is located at a station, thus coming in the 7-cent rate. Then the assessment would be \$8.40 per front foot per year. If the lot were 100 ft. in depth, the assessment would be \$7, and if it were 150 ft. deep, \$10.50 per front foot per year. Again, assume the lot was located farthest away from the station, in the 1-cent zone, then the assessments would be \$1, \$1.20 and \$1.50 per front foot per year for lots 100, 120 and 150 ft. deep respectively.

Just as in the case of the proposed assessment on the city at large, there will be no interest charges against local assessments. This money will not have to be paid back to any one. The funds will be immediately converted to the city's rapid transit system and begin at once still further to enhance the value of the property that has paid the assessment.

As illustrating the local benefits that result from furnishing rapid transit two cases were cited in the report that had been analyzed in detail by the New York City Club. As soon as the New York rapid transit program was announced and construction was begun the land started to increase in value.

RAPID TRANSIT GREATLY ENHANCES PROPERTY VALUES

In upper Manhattan, above One Hundred and Thirty-fifth Street, for a distance of about 4.4 miles the land affected rose from a total value of \$47,306,000 in 1900, before the rapid transit line was constructed, to about \$116,608,000 in 1907 after operation was under way. This represents an increase of 147 per cent during the seven-year period. It was estimated that the normal increase in values would have been about 43 per cent in the same time. The cost of constructing (not equipping) the rapid transit line traversing this district was only a little over \$7,000,000, so the increase in values was about seven times the construction cost.

In the Bronx over a strip one-half mile wide each side of the line there was a similar total increase from an original value of \$33,242,000 to about \$78,047,000—an increase of about 134 per cent, as compared with a normal increase of about 40 per cent. This section of line cost some \$5,700,000 to construct, so the enhancement here due to rapid transit was nearly five and one-half times the cost of the facility.

By means of rapid transit fund certificates, as an extension of payment for each of the seven annual proximity assessments, the landowner will be given the option of spreading each annual assessment in a number of payments over a period of years instead of paying the whole annual amount down at once, thereby making it easier for him to bear his share of the assessment.

The assessments of those who elect to make use of the rapid transit certificates will be combined into a single obligation and made the security for a district loan to be covered by series certificates of indebtedness, which will be marketed by the city in behalf of the property owners. Thus the city will at once realize on the annual assessment by transferring the combined obligations of such taxpayers to investors who will carry the load for a term extending beyond the annual payment period, thus permitting payment in smaller installments than are required by the immediate needs of the city.

This plan is an expedient to lighten the annual burden to the taxpayer, but it will cost him in the end more than if he paid the annual assessment in cash, by the amount of interest he will be required to pay in addition to the principal.

Mortgage bonds are to be issued covering the entire cost of the equipment and cars, or covering about one-third of the total cost of the project, including construction, equipment and cars. These mortgage bonds are to be authorized at the start and issued as needed. They represent the assessment against the rider for the benefits he is to derive from the rapid transit service.

The bonds, being borrowed money, will bear interest and sinking fund charges at the rate of 6 per cent. In this respect they differ from at-large and proximity assessments, which have no interest and sinking fund charges to bear. The interest charged on the bonds during the construction period is included in the amount of the bonds, but after operation begins interest and sinking fund charges are to be paid out of the operating revenues.

In order that the financial plan may be accomplished and the rapid transit program carried out efficiently, the procedure should be as follows:

(a) The Legislature should be asked to amend the present law to permit the methods of assessment herein proposed.

(b) An amendment should also be enacted creating a rapid transit commission; setting up the machinery to guide and control its proceedings; and empowering it to obtain, hold and disburse all rapid transit funds.

(c) The people of Detroit should be offered an amendment to the charter adopting the law as enacted.

(d) Providing the charter amendment carries, the people of Detroit will then be asked to approve a plan of rapid transit routes.

Operating Aspects of Kansas City Safety Train*

One-Man, Two-Man Car, Three-Man Train Adds Greatly to Flexibility of Operation and Introduces Economies as Well as Providing Better Service—Company Enthusiastic About Results

THE safety train developed by the Kansas City Railway has now been in operation long enough to determine its advantages from both the service and economy standpoint. The company claims as the advantages for this one-man, two-man, three-man train that it provides economical base schedule operation, maximum rush-hour capacity, minimum traffic delay and congestion, improved distribution of car loading, great flexibility in operation, practical and satisfactory adjustment of the extra list and greatly improved service for the public, with substantial reduction in operating expense.

The mechanical features of the cars comprised in the safety train were covered in an article in the *ELECTRIC RAILWAY JOURNAL* for March 10, 1923, page 402. To summarize here, these cars embodied several new and original features, as follows:

1. The pioneer use of complete safety devices on double-truck cars with multiple-unit control.
2. The first successful operation of 600-volt main power bus through the automatic coupler, this design including new drum switch design and blow-out coils and original safety features.
3. The original installation of automatic throw-over from trolley to battery supply for energizing the train control circuit, when it is desired to use the motors for regenerative braking in case the trolley pole should come off the wire.
4. An original platform arrangement designed to permit the cars to be used for either one-man or two-man operation, and including safety features developed originally for this company to permit the street fare collector scheme.

The company summarizes the results which have been achieved from their use as follows: A 50 per cent increase in number of non-rush hour seats; a 20 per cent increase in the number of rush-hour seats; 12.6 per cent increase in trip miles; 20.7 per cent decrease in platform expense despite a 5-cent an hour premium for one-man operation; 23.7 per cent decrease in man-hours and 16 per cent fewer total men required to operate the schedule.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

Passengers Boarding at the Four 57-In. Door Openings of a Kansas City Safety Train

The train is shown standing on a 10 per cent grade. The two center doors are handled by conductors on the cars and the doors at the extreme ends of the train are handled by street collectors.

These new cars of the Kansas City Railway are operated in the non-rush hours as single-car units in charge of one man, and the street collectors are not on duty. In the rush hours they are coupled together and operated as two-car trains with three men, supplemented by street collectors who take positions at the front door of the forward car and at the rear door of the second car at important loading points.

In addition to the multiple-unit control and the arrangement for one-man or two-man operation, the flexibility of the train is further enhanced by the fact that the cars may be coupled or uncoupled at any point on the system without adding or removing equipment. As single units, these cars can be operated by one man or two men, and when in trains they may be operated with two, three or four men, as desired. No special storage house or terminal track arrangement is necessary for handling these cars. They can be uncoupled at short loop points or at any point on a line and one car used to fill the space with a minimum of inconvenience to passengers.

The company considers that in using these single

units with one man on a heavy line it is possible to furnish a more satisfactory service than with ordinary two-man operation, as part of the economy is shared with the public in reduced headway. In the non-rush hours the double-truck car with one man affords a comfortable riding unit, usually providing a seat for every passenger. In the rush hour trippers manned by two employees meet the base-schedule cars to which they are coupled, and this two-car unit with three men, aided by street collectors, goes through the rush period. The trippers with the two men then return to the carhouse, leaving the single one-man unit to continue on the base schedule.

FARE COLLECTION PLAN

The control of passenger movement and the system of collecting fares under different methods of operation have been satisfactorily worked out. A swinging gate on the platform can be locked open during two-man operation. For one-man operation it is arranged to swing only outward, thus separating incoming and outgoing passengers. When the operation is changed from one man to two man the fare box is moved from the front platform to the rear, and vice versa.

The scheme of using street collectors has been in use by the Kansas City Railway for some fifteen years, but it becomes of special importance and value in connection with the safety trains. Not only is the schedule speed increased by reducing the loading time, but carloads are equalized, giving more efficient use of the equipment. Sixty-three street collectors are used regularly by the company during the rush hours at heavy loading points in the business and industrial section, and on such special occasions as ball games, circuses, etc. Extra men are used for this duty.

Emphasis is made of the point that the street collectors are more than merely human fare-collecting devices. They are of material assistance in selling the service. Together with the three men on a train, they make five employees at heavy loading points who specially serve the public in the way of information and assistance, as well as expedite the service. The use of street collectors also brings about some reduction in the loss of fares.

Symbols Replace Dates on New Los Angeles Transfers

This New Scheme Eliminates the Waste Which Must Occur with Dated Transfers—Saving Thus Effected Would Be Very Important on Large System

A NEW type of transfer in which symbols replace printed dates has been introduced by the Los Angeles Railway. The change is said to have resulted in a considerable saving over the system formerly used as it eliminates the necessity for a surplus supply of transfers for each conductor.

Fourteen different symbols are used to distinguish transfers in the new system, a few of which are illustrated herewith. These are used without any regular sequence, the transfer bureau deciding that a certain type shall be used for each day, but not divulging the information until the day of issue. For instance, if the transfer bureau decides that a star shall be the designating symbol for the fifth day of the month, the information will be transmitted to the various carhouses

and a large metal sign carrying the designation, as illustrated, is conspicuously displayed to inform the trainmen. All transfers issued to conductors for that day will bear the design of the star. Since the passengers do not know in advance what design will be used, the chance of using old transfers is cut to a minimum.

Transfers formerly used by the company had the letter of the line, the day, month and date superimposed with the date figure in the largest type. In rush hours it was possible to pass a transfer of the corresponding day of a previous month.

Another innovation in the new transfer is that a p.m. coupon is provided, which cuts the number of transfer forms in two. Heretofore different transfers indicated "In" or "Out" trips, and different colored printing designated a.m. or p.m., making it necessary for a conductor to carry four sets of transfers.

With the change from dates to symbols, a considerable saving in printing is effected. Formerly all unused

A Metal Sign Bearing the Same Symbol as the Transfer Is Displayed to Inform the Conductors

Three of the Designs Used to Designate Dates on Los Angeles Transfer

transfers marked for a certain date had to be thrown away, whereas with the new system, unused transfers are saved and reissued the next time the particular symbol is chosen at the designating mark. Since about 330,000 transfers are used on an average day, a very considerable saving is effected.

Mason Starring, president United Railway Investment Company, and Moritz Rosenthal, director of the Market Street Railway, San Francisco, have gone to San Francisco for a conference with city officials on the proposed sale of the Market Street Railway to the city. This matter has been a subject of previous discussion. The question of the valuation at which the property will be taken over is, of course, the important question to be settled.

Electric Locomotives Tested at Erie

120-Ton Paris-Orleans Locomotive Designed for High-Speed Passenger Service in France Develops 105 M.p.H. in Preliminary Tests—Mexican Railway 150-Ton Freight Locomotive Has "Tug-of-War" with Mikado Type Steam Engine

This Paris-Orleans Locomotive Was Designed for Passenger Service at Speeds Up to 80 M.p.H.

TESTS of two new electric locomotives built by the General Electric Company and the American Locomotive Company for foreign roads attracted a number of engineers and railroad men to Erie, Pa., on Dec. 4 and 5. The locomotive built for the Paris-Orleans Railway was run over the test track at speeds between 62 and 81 m.p.h. In preliminary tests run Dec. 2 a speed of 105 m.p.h. had been reached. There was no apparent tendency toward objectionable movements which might have injurious effects upon the track. Records were also obtained by means of the otheograph, described in this paper Aug. 25, page 294, which would indicate freedom from nosing at high speeds. Examinations of the track showed complete absence of any detrimental effects.

There was also exhibited the new Mexican Railway freight locomotive, an exhibition run being staged on the tracks, together with a "tug-of-war" contest with a Mikado type steam locomotive, and a regenerative braking contest. During this test the electric locomotive, connected to send power back to the line, was hauled by the steam unit at a speed of about 14 m.p.h., the steam unit operating at full capacity. As high as 1,800 hp. was sent back into the system.

SOME DETAILS OF THE PARIS-ORLEANS LOCOMOTIVE

In order to determine the type of passenger locomotive to be used on the 1,500-volt electrified lines of the Paris-Orleans Railway, orders were placed with various manufacturers for sample locomotives having approximately 80 tons on drivers and designed for maximum speeds up to 130 km. (80.3 miles) per hour. The G.E. locomotive

is of the gearless type, as shown in the illustration. Each main driving truck has three axles, each carrying the armature of a bipolar gearless motor. The truck frame consists of two steel plate side frames bolted to two end transoms and two intermediate transoms. The journals are of the collarless type, and the end thrust of the axle is taken up by a bronze and babbitt liner located on the outside of the wheel hub and running against a cast steel journal box.

The guiding trucks are also made up of steel plate side frames riveted and bolted to structural steel end frames and cross transoms. A longitudinal center member of structural steel supports a center plate for carrying a portion of the weight of the locomotive at the inner end of the truck. The outer end of this member carries the truck portion of the centering device, which forms a support for a portion of the weight of the superstructure.

A platform built up of structural steel longitudinal and cross members is bolted to each driving truck and supported near its outer end by the roller centering device resting on the guiding truck.

Each cab is of the box type containing a compartment at the outer end for the operator and the remainder for housing the apparatus. The outer end of the cab is tapered to a width of 8 ft. 7½ in., to conform to the specified clearance lines when passing around a minimum radius of 260 ft.

The driving motors are built for operation at 750 volts per commutator, with two motors in series. The field poles, field coils and brush-holders are mounted on the truck transoms, and the truck platform and cab

structures form a part of the magnetic path. The nominal one-hour rating with all covers off and operated on tapped field (75 per cent) is 395 French hp.* at 675 volts and 408 French hp. at 750 volts. The continuous rating with blowers, based on a temperature rise of 120 deg. C., is 355 French hp. at 675 volts.

The under sides of the transom are covered with steel plates, and openings are provided for the forced ventilation. While the locomotive is not now equipped for regenerative electric braking, space is provided for the installation of equipment for this purpose if desired.

The control equipment is type PCL, electro-pneumatically operated, non-automatic, giving twenty-three resistance steps and eight running points with various groupings of the motors.

For speeds above the full field running connections, tapped field positions are provided. Two of these steps can be obtained in the series and series-parallel position and one in the full parallel position. Provision is made for disconnecting the motors on either half of the locomotive in emergency, so that the three remaining motors can be operated in series.

A master controller is located on the left-hand side of each operating cab, energizing the control circuits by means of current from a 72-volt storage battery.

Overload and short-circuit protection is secured by a high-speed circuit breaker which trips and inserts resistance in the circuit. After the resistance is inserted, a pair of line contactors then opens the circuit. This reduces the damage that can be done and protects the substation apparatus by quickly eliminating excessive power demands.

The auxiliary equipment includes air compressors, blowers and heaters which are operated through a separate circuit taking power from the 1,500-volt trolley. Forced ventilation for the traction motors is obtained by multivane type blowers, one of which is located directly above each motor. The three blowers on each

driving truck are direct connected to an inclosed series-wound 1,500-volt motor, and the two motors may be connected in series to reduce power consumption when the locomotive is operated at light loads.

The air brake equipment is of the French Westinghouse type for double-end operation and for control of both locomotive and train. Compressed air is furnished by two CP 32-A 1,500-volt compressors having a total piston displacement (at the low pressure piston) of about 3,600 liters (127 cu.ft.) per minute when delivering air at a pressure of 10 kg. per square centimeter (142 lb. per square inch). The compressor is of a two-

The Locomotive for the Mexican Railway Is for Heavy Mountain Grade Service

stage type with horizontal cylinders fitted with single-acting pistons.

THE MEXICAN LOCOMOTIVES ARE FOR FREIGHT SERVICE

The ten 150-ton, 3,000-volt locomotives to be used on the initial electrification of the Mexican Railway are of the geared type, and are designed for slow-speed freight service.

A single cab is mounted on two equalizer frames, which in turn are carried upon three two-axle articulated trucks. A motor is geared direct to each axle with twin spring gears.

The three trucks have steel side frames, to which the end frames carrying the draft gear and articulated joints are bolted. The superstructure is carried on center plates on the truck transom, bolted to the side frames at their midpoint, and the whole is carried on equalized semi-elliptic springs.

On each of the six axles there is a twin-geared G.E. 278-A railway motor with forced ventilation. These motors are designed to operate two in series on 3,000 volts. Each motor is supported on its axle by suspension bearings and on the transom by a spring nose support. An eighteen-tooth forged steel pinion is mounted on each end of the armature shaft and meshes with a ninety-tooth cushion type gear on the axle. This design permits a small movement of the rim about the gear center, thus tending to equalize the stresses in the gears and pinions and to minimize the shocks on the teeth.

The auxiliary machinery consists of a 3,000/1,500-volt dynamotor which has a 4-kw., 65-volt control generator mounted on a shaft extension, a 1,500-volt regenerative exciter set, two 1,500/3,000-volt motor-driven blowers and two 1,500/3,000-volt air compressors. The dynamotor provides 1,500-volt power for operation of the

WEIGHTS, RATINGS AND DIMENSIONS OF PARIS-ORLEANS ELECTRIC LOCOMOTIVES

Electrical data:	
Nominal voltage of system (d.c.)	1,500
Tractive effort at one-hour rating and 1,350 volts, kg.	6,630 (14,586 lb.)
Tractive effort at continuous rating and 1,350 volts, kg.	5,700 (12,450 lb.)
Tractive effort at 30 per cent tractive coefficient, kg.	21,800 (47,960 lb.)
Speed at one-hour rating and 1,350 volts, km.p.h.	96.5 (60 m.p.h.)
Speed at continuous rating and 1,350 volts, km.p.h.	101 (63 m.p.h.)
Number and type of motors	Six G. E. 101-A (750/1,500 volts)
Total horsepower of locomotive at one-hour rating	2,370*
Total horsepower of locomotive at continuous rating	2,130*
Mechanical data:	
Track gage, meters	1.45 (56 1/2 in.)
Wheel arrangement	4 — 6 + 6 — 4
Diameter of drivers, mm.	1,200 (47.2 in.)
Diameter of guiding wheels, mm.	915 (36 in.)
Total wheelbase, meters	16.32 (53 ft. 6 in.)
Maximum rigid wheelbase, meters	2.85 (9 ft. 3 1/2 in.)
Width over all, meters	2.93 (9 ft. 6 in.)
Length over buffers, meters	19.02 (62 ft. 0 in.)
Height over trolley, locked down, meters	3.84 (12 ft. 6 in.)
Weights:	
Total weight on drivers, kg.	72,600 (159,720 lb.)
Weight per driving axle, kg.	12,100 (26,765 lb.)
Total weight on guiding axles, kg.	35,800 (79,200 lb.)
Weight per guiding axle, kg.	8,950 (19,690 lb.)
Electrical and air brake equipment, kg.	46,400 (102,880 lb.)
Mechanical equipment, kg.	62,000 (138,600 lb.)
Total weight, kg.	108,400 (238,480 lb.)

*French horsepower of 736 watts.

blowers, compressors and the regenerative exciter set. The control generator furnishes current at 65 volts for lights, headlights, foot warmers, control circuits and for charging the storage battery.

The two air compressors are of the two-stage horizontal-cylinder type and have a total piston displacement of 150 cu.ft. per minute when delivering air against 130-lb. pressure. They operate two in series on 3,000 volts.

The air brake is Westinghouse No. 14 EL, double-end, straight and automatic equipment, arranged for double-heading locomotives. Provision is made to prevent application of the air brakes on the locomotives during regenerative braking, while the brakes may be applied on the remainder of the train.

The locomotives are equipped with type PCL electro-pneumatic control for non-automatic, multiple-unit operation. The master controllers are arranged to give a total of thirty-one accelerating steps and nine running points, which for a tractive effort of 50,000 lb. and 2,700 volts on the contact line correspond to speeds of approximately 5.4, 6.0, 6.75, 11.4, 12.8, 14.2, 17.4, 19.6 and 21.6 m.p.h. This range of speeds is obtained by connecting the motors six in series, three in series in two parallel circuits, and two in series in three parallel circuits. One full-field point and two reduced-field points are included on each connection.

REGENERATIVE BRAKING IS PROVIDED TO CONTROL SPEED ON DOWN GRADES

Regenerative braking on the down grades is accomplished by exciting the fields of the traction motors by the regenerative exciter. Fifteen regenerating steps are provided for on the master controllers for each of the three motor groupings.

The main motor circuits are protected by a quick-acting circuit breaker which serves as a line breaker, as well as to give overload protection. Current is collected through one or both of two pantograph trolleys, which have a range of 15 ft. 5 in. to 24 ft. above the rail. They are raised and held against the wire by air pressure and are retracted by gravity when the air pressure is released.

The cab is 47 ft. 6 in. long and 10 ft. wide. An apparatus compartment is in the middle of an engine-man's cab 5 ft. long at each end. The rheostats extend each way from the center of the cab about one-half the length of the apparatus compartment. Their height is approximately 3 ft. Near each end is a ventilating flue to carry off the heat. The roof of the rheostat compartment is insulated against heat and is used as a shelf upon which the auxiliaries are mounted.

The control apparatus compartment on No. 1 end contains the main switch, quick-acting circuit breaker, lightning arrester, other protective apparatus and some of the accelerating contactors. The corresponding compartment on No. 2 end contains the cam switches for grouping the motors for the different motoring and regenerating combinations, the reverser, the motor cut-out switches and the remainder of the accelerating and field reducing contactors.

The Mexican Railway Company, Ltd., is one of the oldest railways operating in Mexico. Its main line runs between Vera Cruz and the Gulf of Mexico and Mexico City. The section between Orizaba (about 70 miles inland from Vera Cruz) and Esperanza, a distance of 30 miles, is now being electrified. This section,

DIMENSIONS AND DATA OF ELECTRIC LOCOMOTIVES FOR THE MEXICAN RAILWAY

Electrical data:

known as the Maltrata incline, includes the most scenic country in Mexico.

Because of the mountainous country through which the railroad passes from the sea level at Vera Cruz to the great Mexican plateau, with a change in elevation of some 8,000 ft. in 100 miles, many severe grades and sharp curves are encountered. A difference of 4,000 ft. in elevation exists in the 30-mile section which is now being electrified.

Freight trains weighing 700 tons will be taken up the grade with two electric locomotives, one at the head end and one at the rear. Trains of about the same weight will be brought down the grade with one locomotive by regenerative electric braking. Speeds both up and down grades for freight trains will average about 15 m.p.h.

All but an occasional passenger train can be taken over the grades by a single locomotive. As it is considered unsafe to run trains down the grades and around the sharp curves at more than 20 m.p.h., the same locomotive with the same gear ratio will be used for freight and passenger service. Speeds of passenger trains will average about 18 to 20 m.p.h. both up and down grades, although the locomotives can operate at a maximum speed of 33 m.p.h.

A Street Car in Copenhagen, Denmark

How would people of the average American city like cars of this variety? Note three-way egress and half-covered upper deck with less than standing headroom under the roof.—Copyright, Gilliam's Service.

Platform Men Pass Civil Service Tests

San Francisco Requires Applicants for Position of Motorman and Conductor to Take Athletic Examination, Including Ladder Climbing, Horse Vaulting and High Jumping, as Well as an Examination on Relative Capacity and Knowledge of Duties
—Each Examination Is Considered of Equal Importance

PROSPECTIVE motormen and conductors must pass an athletic test before being employed on the San Francisco Municipal Railway. They must be able to climb a ladder by their hands, dip on the parallel bars at least five times, vault the horse, and otherwise prove that they are in fit muscular condition, besides passing the more common medical examination for organic troubles and the usual test for eyesight and hearing. The specification for motormen and conductors on the San Francisco Municipal Railway has always called for a rather stiff physical examination, but the requirements have been made more strict recently, partly because the system has no age limit for new men and partly because all employees of the municipal railway now, after the first six months of their employment, automatically become members of the retirement system of the city and county of San Francisco. This arrangement became effective on April 1, 1922.

All employees of the San Francisco Municipal Railway, except executives and one or two experts, come under the civil service regulations. Hence, candidates for the position of motormen and conductors have to be passed by the Civil Service Commission of San Francisco before they are eligible for appointment.

CIVIL SERVICE TESTS

The athletic test for motormen and conductors, already mentioned, has a relative weight for eligibility of 50 on a scale of 100, and a written examination, called a test for relative capacity and general knowledge of duties, also has a weight of 50 on the scale of 100. All of these three tests, except the test on general knowledge of duties, are the same for motormen and for conductors. Applicants must receive a rating of not less than 75 per cent on each of these tests or are rejected. The practice is to conduct first the athletic test. If that is passed successfully, applicants for positions as platform men will receive copies of the rules of the municipal railway to study for the test on general knowledge of duties.

The "athletic test" consists of the following:

1. *Ladder Work*—Hand over hand, up and down ten rungs; only one hand allowed on each rung; perfect mark, 10 credits.
2. *Lifting 50-lb. Dumbbell*—Five consecutive lifts with each hand. Lifts to be made from lowest reach of arm to highest reach, without aid of jerk or swing, while standing erect with feet close together; perfect mark, 10 credits.
3. *High Jump*—4 ft., 10 credits; 3 ft. 8 in., 8 credits; 3 ft. 4 in., 6 credits; use of springboard not permitted.
4. *Vaulting the Horse*—Perfect vault over horse, 4 ft. 6 in. high, without touching it with any part of body except the hands, 10 credits; good vault (feet slightly touching horse), 8 credits; fair vault (body slightly touching the horse), 6 credits; slide over horse, 0.
5. *Dipping on Parallel Bars*—Five dips at 2 credits each; dips must be made with legs straight and without assistance of kick or swing.
6. *Carrying 150-lb. Sack of Sand*—Sack must be lifted from floor, placed on shoulder and carried up and down six steps; mark 10 credits. No partial credits, and no more than two trials allowed.

7. *Running* (distance about 140 yards)—Eighteen seconds, 40 credits; nineteen seconds, 37½; twenty seconds, 35; twenty-one seconds, 32½; twenty-two seconds, 30; twenty-three seconds, 25; twenty-four seconds, 20; twenty-five seconds, 15; twenty-six seconds, 10; twenty-seven seconds, 5. Fifth seconds to be rated proportionately.

As explained, applicants must also pass a satisfactory medical examination before a physician appointed by the commission. Those unable to hear with each ear ordinary conversation at a distance of 20 ft. or unable to read with each eye without glasses at a distance of 20 ft. letters on Snellen's eye chart marked "30" will be rejected. Applicants for both motormen and conductor positions must also pass a test as to their color vision. They must be citizens of the United States, twenty-one years of age or over, and residents of San Francisco for at least one year preceding the examination. Under the city charter, war veterans are entitled to claim a preference of five credits, but to secure this credit they must file with the commission, with their application for the position, a certificate of honorable discharge or of honorable active service.

WRITTEN TESTS ON INTELLIGENCE

The written examinations on relative capacity and general knowledge of duties are conducted at certain times announced in advance by the Civil Service Commission. The regulations in regard to these examinations are printed and very definite. Thus, during the course of the examination no participant is permitted for any reason to leave his seat, unless he first turns in his examination papers, and he then will be considered as having withdrawn from the examination. Nothing is permitted on the desks of the competitors except the examination booklet and pens and ink and blotters furnished by the commission. Applicants may use their own fountain pens only if those pens are supplied with ink that dries black. Applicants are advised that no questions should be asked of the monitors in charge of the examination because none will be answered. If the applicant thinks he finds cases of ambiguity or oversight in the examination papers or instructions which are the fault of the commission, they will not be discussed during the examination. If the applicant wishes to bring them up, in explanation of his failure to do his work properly or for any other reason, he can make such complaint by writing to the commission within three days after the examination.

The practice in conducting the examination is that each applicant who has passed the athletic test and has applied for permission to take the written test will receive a credential. He keeps this credential until the written examination and it must be shown at the door of the examination room to secure admittance. The candidate is then assigned to a seat and places the credential before him on his desk, leaving it open and face up, so that it can be quickly inspected and collected by the monitor. After the credentials have been collected, the examination booklets are distributed face up.

The written examination for a motorman or a conductor lasts about forty-five minutes. If a person wishes to take an examination for both positions, he is permitted to do so. This will take about fifteen minutes longer.

The time spent in these examinations is very definitely regulated by gong signals. At the first gong signal, the applicant is told to take up his pen and write his name and address on a blue gummed identification slip which he finds attached to the cover of his examination booklet. After writing his name on this sheet he is told to fold it over and paste it down by means of a gummed edge that is provided, and he is warned not to write anywhere else on the examination paper his name or other identification mark.

Altogether there are six tests, and the time for the beginning and ending of each is indicated by a gong signal. At the close of the forty-five minutes, the gong is rung three times. This means that all applicants for positions must stop writing and must rise and stand by their desks until the monitor collects the examination booklets. Then at four strokes of the gong applicants leave the hall.

EXAMINATION ON RELATIVE CAPACITY

There are five examinations on relative capacity, and, as explained, these are the same whether the candidate wants employment as a conductor or as a motorman. Each examination question is so drafted that the answer is very brief and can be written on a blank line next to the question. Figuring for the arithmetical test must be done on the back of the cover sheet of the booklet.

The first test in relative capacity is on some simple questions in arithmetic. A few typical questions taken from the examination sheet of Jan. 31, 1922, follow:

At 7½ cents each, how much will a dozen power fuses cost?

How many weeks will it take to pay for a \$35 uniform at \$10 down and \$5 at the end of each week?

If a conductor starts on his run with \$5.75 and collects seventeen 5-cent fares, how much will he then have?

How many 5-cent fares will it take to pay for the damage done in a collision with an automobile if the cost was \$150?

The second examination is on "sentence meanings." There are twelve groups of four sentences each, and the applicant in this test is required to make a cross mark in the parentheses before the sentence which has most nearly the same meaning as the numbered sentence heading the group. The upper part of a recent examination sheet, with four typical questions, is reproduced below:

TEST 2 SENTENCE MEANING Relative Capacity

In each group of sentences below, make a cross (X) in the parentheses before the one sentence which has most nearly the same meaning as the first sentence (in capital letters). The first example is already marked correctly. Work until the gong rings and then start on Test 3. *Any example where more than one sentence is marked in any way will be counted as incorrectly answered.*

1. **MAKE HAY WHILE THE SUN SHINES.**
☒ Take advantage of your opportunities.
☐ Don't work too hard.
☐ Don't stay up too late.
2. **MANY ARE GOOD BECAUSE THEY CAN DO NO MISCHIEF.**
☐ Evil sees as evil thinks.
☐ The good can do no wrong.
☐ The cat is honest when the meat is out of reach.
3. **WHERE THE WILL IS READY THE FEET ARE LIGHT.**
☐ Where there's a will there's a way.
☐ Expression is the dress of thought.
☐ A burden which one chooses is not felt.

4. FIGS DO NOT GROW ON THISTLES.

- () Great oaks from little acorns grow.
 () Good does not come from evil.
 () Faint praise is often strong censure.

The third test is that of "reasoning by analogy." Here the applicant is required to check one of four words which most correctly completes a definite sentence. Here also an example is given as shown below, the proper word being underscored in the first example of the four quoted taken from the examination paper.

TEST 3 REASONING BY ANALOGY Relative Capacity

In each example below, draw a line under the only one of the four words in the column which is the right word to complete the sentence. The first example is already marked correctly, for roar is what a LION does just as bark is what a DOG does. Answer as many as you can before the gong rings; then begin on Test 4. *Any example where more than one word is underlined will be counted as incorrectly answered.*

DOG is to BARK as LION is to _____
 zoo
roar
 animal
 man

FLOORWALKER is to STORE as POLICEMAN is to _____
 uniform
 badge
 street
 authority

STREET CAR is to WAGON as FAST is to _____
 wheel
 trolley
 slow
 horse

RULER is to LENGTH as CLOCK is to _____
 strike
 time
 second
 wood

CRIMINAL is to PRISON as PATIENT is to _____
 jail
 hospital
 court
 medicine

FRAME is to PICTURE as LAKE is to _____
 island
 water
 drawing
 river

STREET CAR is to PASSENGER as PATROL WAGON is to _____
 car barn
 ticket
 fare
 prisoner

DOG is to OLD as PUP is to _____
 kitten
 young
 small
 play

Test 4 is on "word knowledge." Here the applicant is required to draw a line under the one word which in each group means the opposite or most nearly the opposite of the top word in each group of five words. In the first example, "soft" is underlined because it means the opposite of "hard." Six examples are given from the examination paper.

TEST 4 WORD KNOWLEDGE Relative Capacity

In each of the lists below, draw a line under the one word which means the opposite or most nearly opposite of the top word in the list. The first one is already marked correctly—"soft" is underlined because it means the opposite of "hard." Answer in order as many as you can until the next gong signal, then start on Test 5. *Any example where more than one word is underlined will be counted as incorrectly answered.*

HARD	CLEAN	FROM	VALLEY	COMMON
hardy	lean	upon	mountain	cheap
<u>soft</u>	dirty	form	river	law
smooth	urge	by	mine	unusual
pliant	screen	to	gravel	costly
MARRY	FORGET	INNOCENT	REVEAL	MINUS
ceremony	idea	guilty	conceal	plus
divorce	memory	proof	conceal	minor
court	remember	convince	relate	minority
engage	vision	doubt	veal	bonus
CIVIL	MENTAL	CORRUPT	AMIALE	BLISS
civic	brain	eruption	surly	lass
martial	nerve	honest	amenable	blithe
marital	thought	home	pliable	aged
revile	material	correct	liable	agony

The fifth and last examination under relative capacity is on penmanship. Here the applicant is asked to copy line for line and word for word the way it is printed in the examination sheet the following pledge:

"I pledge allegiance to my flag, to the Republic for which it stands; one nation indivisible, with liberty and justice for all."

There are spaces where this pledge can be copied a number of times until the gong sounds for the next examination.

KNOWLEDGE OF DUTIES

The final test is on knowledge of the duties of the position for which the man has applied. In each examination there are 100 questions relating to practical details of the services with which the applicant has presumably become familiar through a study of the rule book. These questions are arranged so that they can be answered very easily if the applicant knows the right answer. The heading of the examination blank for conductor with the first eight questions, two of which are answered as examples, as reproduced below, is followed by several questions in similar form from the examination paper for motormen.

TEST 6 KNOWLEDGE OF DUTIES CONDUCTORS

Some of the following statements are true and some are false. If the statement is true underline TRUE. If the statement is false, underline FALSE. Do as many examples as you can before the next gong signal; then stand up and remain silent in your place until the following gong signal. (See front cover.) Any example where both true and false are underlined will be counted as incorrectly answered. The first two statements are samples correctly underlined.

1. TRUE FALSE The Bulletin Board must be examined daily for special bulletins posted thereon.
2. TRUE FALSE Ignorance of rules will be accepted as an excuse for violation of same.
3. TRUE FALSE Verbal orders of subordinate officials must be promptly obeyed.
4. TRUE FALSE "Oversleeps" are not entered on the employee's record.
5. TRUE FALSE The official badge, punch, and cap ornament will all be furnished by the Railway.
6. TRUE FALSE The loss of rule book must be reported immediately to the Car Dispatcher, or person in charge of the office.
7. TRUE FALSE The record kept of each employee should be filled out in careful detail and made as full as possible.
8. TRUE FALSE The penalty for the fourth oversleep in a calendar month is ten days' suspension.

TEST 6 KNOWLEDGE OF DUTIES MOTORMEN

27. TRUE FALSE Motormen will recognize buzzer signal both to stop or to start car.
28. TRUE FALSE Except when regulated otherwise, cars must be brought to a full stop at street railway intersections.
29. TRUE FALSE Except when regulated otherwise by special bulletin, cars will stop at the near side of all intersecting streets to receive and discharge passengers.
30. TRUE FALSE When stopping at a painted stop mark the motorman must stop car with fender roll four feet behind such stop mark.
31. TRUE FALSE The motorman must close front gates immediately after starting car.
32. TRUE FALSE A motorman may start car on signal from conductor collecting at front gate.

No credit is allowed in the examination of either motormen or conductors for previous experience.

In spite of the rather rigorous type of examination required, it is interesting to note that a fairly large number of men are able to pass both athletic and written tests. Thus, in the last examination held, the physical test for motormen was taken by 695 applicants, of whom 620 passed. The same test for conductors was taken by 701 applicants, of whom 615 passed. The written test for motormen was taken by 574 persons, of whom 337 passed. The written test for conductors was taken by 575 persons, of whom 370 passed.

TESTS FOR INSPECTORS

Inspectors on the San Francisco Municipal Railway are promoted from the ranks of the motormen and conductors. The examination for inspectors is somewhat similar to that required of motormen and conductors, except that no athletic test is required. There are the four examinations on relative capacity and the one on penmanship, quite similar to those already described for motormen and conductors, but the examination on knowledge of duties covers, of course, the duties of the office which the applicant is seeking. The questions are arranged, however, in a similar manner to those for motormen and conductors, so that the applicant may simply underscore one of two words to indicate his answer to the question. Typical questions from the examination for inspectors, car dispatchers, car starters and receivers are given below:

TEST No. 6 KNOWLEDGE OF DUTIES

INSPECTORS, CAR DISPATCHERS, CAR STARTERS AND RECEIVERS

- | TRUE | FALSE | |
|------|-------|---|
| | | It is the duty of the Receiver to see that the conductors take outfits for their runs at the time called for by the time schedules. |
| | | It is the duty of the Inspector to see that all conductors' outfits are properly accounted for and restored to their proper places. |
| | | Before cars are taken out of the barn in the morning the Car Starter must have posted all car numbers and car box numbers. |
| | | The Dispatcher must arrange the daily detail of crews. |
| | | The Receiver must provide emergency crews each day for the following day. |
| | | An employee shall not discuss with passengers the business of the railway in a manner detrimental to its welfare. |
| | | The Flood Building is at the corner of Powell and Market Streets. |

It is interesting to note that out of the 208 applicants who took the last examination for inspectors, 156 passed. A general average of 75 per cent or better is required.

WAGES PAID

The present scale for platform men, effective Sept. 16, 1923, is as follows: Conductors and motormen, 67½ cents per hour; bus operators (recruited from the ranks of conductors to operate one-man buses), 72½ cents per hour; motormen on work car and track grinding car, 72½ cents per hour.

All of these employees are allowed time and a half for overtime after eight hours and twenty minutes, and are required to lay off one day in seven. Eight hours is the basic day for all employees. Each employee has a vacation of twelve days a year with pay.

The municipal railway system has two grades of inspectors, first and second. This grading is somewhat arbitrary, as it is based on the duties performed and not on the percentage obtained in examination. Road

or line inspectors constitute the first grade and starters and receivers the second grade. Dispatchers are taken from the ranks of the road inspectors.

RETIREMENT SYSTEM

The city of San Francisco has a retirement or pension system with death benefits for all city employees, and since April 1, 1922, the municipal railway employees have been included in this system. In fact, membership in this retiring fund is compulsory after six months of service for all municipal railway employees who receive salaries not to exceed \$500 a month.

The amount of the payments made to the fund by the employees depends upon the age and salary earned, and an equal amount to the sum paid by the employee is contributed to the fund by the Municipal Railway. The cost to the municipal railway system for all employees, under the present wage scale, is approximately 9 cents per car-hour, made up of 6½ cents for the platform men and 2½ cents for other employees. Retirement is obligatory at the age of 70, but employees who have completed ten years of continuous service and have reached the age of 62, or those who have completed thirty years of service and have reached the age of 60, may retire any time after reaching these ages, if proper notice is given to the authorities.

The annuity received consists of the actuarial equivalent of the contributions made by the employee, plus those made by the municipal railway in his behalf, plus an additional pension, purchased by the contributions of the city and equal to 1½ per cent of his final compensation, multiplied by the number of his years of service, provided if he is 62 or more. If less than 62 and with thirty years' service, a slight modification of this method of calculating the pension is followed. Employees who withdraw from the service of the municipal system before becoming eligible to an annuity are entitled to their own accumulated contributions. There are also certain disability and death benefits.

The municipal railway has 1,070 employees, of whom 820 are platform men.

How Kentucky System Has Been Modernized*

Various Measures Taken in the Successful Elimination of Bus Competition by Means of Superior Service Are Summarized

THE developments that have been carried out in modernizing the plant and operation of the Kentucky Traction & Terminal Company, Lexington, Ky., have been covered step by step as they were accomplished in various issues of *ELECTRIC RAILWAY JOURNAL*. To bring these together in a summary, however, makes a story of accomplishment that is worth recording.

The Kentucky Traction & Terminal Company operates 70 miles of interurban lines and 21.5 miles of city lines in and around Lexington. It has completely re-equipped its railroad system with a newly developed type of light-weight one-man double-truck passenger and freight cars, the former designed especially to give maximum comfort, speed and economy of operation. This complete replacement of rolling stock made it possible for the company to standardize on one type of

motor and general equipment. The exchange of heavy equipment for light-weight cars has materially reduced the actual depreciation in the physical structures of track and roadway and has thereby reduced the future cash expenditures and prolonged the life of the investment.

For the public, the company has reduced all classes of transportation charges on the interurban system by 16½ per cent and has increased the service from a headway of one and one-half hours to a headway of one hour on all lines. It has given the public cars to ride in that it believes are as comfortable as a private automobile, and equal, if not superior, to any form of electric railway car now being operated. The public has responded with a generous measure of good will. The success of the company's modernization program, the attractiveness and comfort of the new cars and general progressive policy have made the company very popular.

The security holders have benefited because the management has converted the railway property from a situation where for the year prior to the conversion of the equipment an operating deficit existed into a property with an operating surplus over and above all charges. The property has thus been made self-supporting and the investment placed on a sound earning basis and one which the company believes can safely be maintained in the future against any form of competition.

From the standpoint of the car operator, the company's complete one-man operation has placed additional responsibility on the operator for which he is being paid a higher compensation. The company feels that it is making a better man out of him for himself and for the company as he is given a superior position.

The company has kept the public informed through consistent advertising, stating its activities and position in frank and definite manner. A recent advertisement stated the company's position as follows:

"During the past ten years it has always been our aim to keep abreast of advancing conditions and so to align our services that we may at all times be able to provide you with facilities commensurate with the population of those communities we serve. We shall continue to serve you to the best of our ability at rates equitable with the character and quality of good service rendered, and in line with principles of efficient business administration."

To carry out its construction program involving an expenditure of \$375,000, which was a heavy commitment for this company in the face of a deficit from operation and organized bus competition, required courage, vision and conviction on the part of the company and its board of directors that the industry is permanent and can be placed on a sound earning basis if properly developed along lines that make the service of more than ordinary value to the public.

Some of the operating results accomplished are a reduction of 63 per cent in late trains, expressed in hours; a reduction of 41 per cent in the ton-miles of cars operated, despite the increase in service; a reduction of 18 per cent in the kilowatt-hours of energy consumed, although there was an increase of 8.4 per cent in cars operated. Revenue per car-mile has decreased from 45.6 cents to 37.1 cents, but operating expenses have also been reduced from 35.4 cents to 22.3 cents. The energy consumption per car-mile is now 2.92 kilowatts, as compared with 4.93 formerly.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

Association News & Discussions

One-Man Car Experience*

One-Man Operation Has Shown Considerable Economies on Beaver Valley Line—Favors Double-Truck Car to Birney Type—Troubles Experienced and Changes Made and Results Obtained Are Detailed

BY W. H. BOYCE,

General Manager Beaver Valley Traction Company,
New Brighton, Pa.

SO MUCH has been said and is known of the one-man car being a life-saver for the smaller properties that today it becomes a question not of whether a company can get along without switching from two-man to one-man operation, but whether or not it is not mismanagement for a company to operate two-man cars when one-man cars would fill all of the requirements.

Aside from the operating problems entailed by reason of cars of certain routes operating into congested portions of a comparatively few cities, and in the full knowledge that there are other conditions such as several dangerous railroad crossings on comparatively short routes, and kindred problems, yet in my opinion there is no reason why more or less one-man cars cannot or should not be operated on most all properties throughout the country.

Of course there are one-man cars, and then again there are one-man cars.

There is no doubt that the single-truck, slat-seated, one-man car will receive a black eye in any community where an attempt is made to substitute it for comfortable, good-appearing, double-truck cars, particularly if track conditions are not good. But a rebuilt double-truck car or a new double-truck car properly heated and fitted with upholstered, properly spaced seats, mounted on smoothly riding trucks, can in most, if not all, cases be made to supplant the existing two-man service, at the same time rendering a better, more economical service.

I have not visited every one-man property in the country, nor have I sent out questionnaires to the companies operating one-man cars; therefore, I feel that I should confine this paper to our experience with the one-man car on the property of the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway Company.

It might be well to explain that our system is split up into 2-mile zones, that we have a base fare of 5 cents for each zone, and that one route has as many as seven zones. Cars that are

operated through more than two zones are equipped with Shanklin zone fare machines, with the aid of which the operator issues a receipt to the passenger when he boards the car and deposits his fare in the locked fare box. The passenger retains this receipt until he reaches his destination, surrendering it to the operator as he leaves the car. In addition to operating the car, issuing and accepting zone checks as above described, the operator makes change, sells several kinds of weekly passes, issues transfers, and when we have our bargain sale of tickets twice annually he sells twenty-four tickets for \$1.

With the exception of six two-man cars that are being used for tripper service only and which on account of their age and condition we do not deem it economy to rebuild, we are operating 100 per cent one-man cars. Of these, twenty are standard Birney safety cars, manufactured by the Osgood Bradley Car Company, ten of which were put into service in September, 1920, and the other ten were put into service on Aug. 5, 1921. Six of our one-man cars are 36,000-lb. Brill semi-convertible cars, which we have rebuilt for one-man operation and on which all safety features were installed. These cars were equipped with new spring-cushion, cane-upholstered seats; the motor frames, trucks and car bodies were thoroughly overhauled, and the bodies painted inside and out, the exterior having been changed from a dark red to a taxicab yellow. We also have six new double-truck, one-man, two-man cars which are just being put into service.

I wish to call to your attention the fact that these six new cars are equipped with a storage-battery emergency lighting system; aluminum stanchions; Golden Glow 94-watt headlights; Holophane shades; double air-operated doors; four air sanders; electrolytic lightning arresters mounted in cab; and the car bodies are mounted on Standard C.P.-35 trucks, which is the easiest riding truck that we have ever had on our property.

Although in some few cases our headway between cars was decreased with the installation of the one-man

car, our hauling is so comparatively light through the day and after the rush hour in the evening that for the ordinary business offered the single-truck car provides sufficient capacity, and as a consequence in most all cases our two-man cars have been replaced with one-man cars, adequate tripper service being furnished to take care of the morning and evening rush-hour periods.

It is not very often that a street railway manager admits that he has made a mistake, but I will say to you very frankly that we made a serious mistake when we purchased twenty safety cars. On some of our lines we have an interval of twenty minutes between cars through the non-heavy hauling hours, during most of which time the single-truck car has sufficient capacity to handle the ordinary business offered, but if one of them happens along at the finish of a football or basketball game, a concert, a dance, a lodge meeting, at the time of a train or interurban connection, or what-not, there is oftentimes not sufficient capacity properly to accommodate the passengers presenting themselves for transportation.

These things do occasionally happen, regardless of the fact that we have tried our best to get the officers of lodges and management of theaters, etc., to advise us of any unusual number of people that gather in their places of business or amusement, so that we may furnish adequate car service to take care of them.

We have not found it necessary to slow down our schedules by reason of the adoption of the one-man car, but, as will be explained later, we have made some improvements that are partly responsible for this. There is and has been for a number of years a slow portion of the schedule which starts at 3:21 in the afternoon and continues until 8 o'clock at night to take care of the rush-hour load. The slowest that any of our cars are operated on this schedule is 9 m.p.h., and during the off-peak hours the rate is 12 m.p.h., with no lay-over on our heaviest hauling lines.

On the two-zone routes, the passenger pays-enter in the first zone and pays-leave in the second zone. This works out very satisfactorily.

We have had but little trouble in concluding a suitable agreement with the Amalgamated Association regarding the operation of these cars. We know that the majority of our car operators would rather operate one-man cars at 5 cents per hour increase in their wage than operate two-man cars. Last year at agreement time,

*Abstract of paper presented before Pennsylvania Street Railway Association at Harrisburg, Pa., Dec. 4, 1923.

anticipating that we were going to a 100 per cent one-man operation, in addition to providing for paying one-man car operators 5 cents per hour in excess of the rate for two-man car operators, we gave the officials of the association a letter stating that so long as it became necessary for us to maintain crossing flagmen at certain points, we would put on these flagmen jobs trainmen who on account of age or other disability were not competent to operate one-man cars, and pay them at the former year's rate of pay, which is 7 cents less than the present two-man car rate, and of course 12 cents less than the present one-man car rate.

We had no difficulty with the councils or officials in the thirteen boroughs through which we operate when we installed the one-man car.

To make the operation of these cars easy and speedy for the trainmen, we have installed Nachod automatic block signals and electric track switches at all points where either can be used. To further aid the trainmen in making their schedule, we have installed at our heavy transfer points (where cars of three routes connect every ten minutes) an automatic signal system by means of which the operator of a car upon arriving at the transfer point knows that there is or is not a car of the connecting line within one-half mile of the transfer point. This has resulted in a considerable saving of time. Prior to the installation of these signals we had a rule requiring the operator of a car to wait at the transfer point for three minutes. If the approaching car was not in sight (the distance at which it became visible in either direction being about two squares), the operator was then permitted to proceed. Under the present arrangement, if after the operator has waited one and one-half minutes the block does not indicate that his connecting car is approaching he may proceed.

REDUCTIONS IN OPERATING EXPENSES

Today we carry on our list sixty-five trainmen, thirty-nine of whom are scheduled for the operation of regular runs, and twenty-one for trippers. Four years ago we carried on our list 110 men, eighty-nine of whom were scheduled for regular runs, and ten for trippers; while twelve years ago we were compelled to carry on our list ninety-eight men, eighty-eight of whom were scheduled on regular runs. Today our receipts are running in the neighborhood of \$630,455 per year; four years ago they were \$599,559 per year, and twelve years ago they were \$341,066 per year. In other words, today our receipts are more than twice what they were twelve years ago, and we employ thirty-three less trainmen, trippers and regular runs both being considered.

We do not believe it necessary to go into detail on the man-hours and car-hours, except to say that for the first ten months of this year, had we been operating two-man instead of 100 per cent one-man cars, our trainmen's

wages on the present wage rate would have shown an increase of \$85,000, and at that rate we would soon be in the hands of the sheriff.

As regards our car mileage and power costs, for the year prior to the installation of the one-man cars, 1919, our total car mileage was 1,522,752, while the power cost was \$91,332. In September, 1920, we added ten one-man cars, and the total car mileage in 1920 was 1,544,335, and the power cost for that year was \$78,910.19. In August, 1921 we added ten additional one-man cars, and our car mileage for that year was 1,691,383, the power cost for that year being \$86,811. For the year 1922 the total car mileage was 1,677,457, and the power cost for that year was \$69,798. For the first ten months of 1923 our total car mileage was 1,447,062, and the power cost was \$59,321, for the Beaver Valley Traction Company and the Pittsburgh & Beaver Street Railway, which was \$8,012 less than power for the corresponding ten months of the previous year. This is due to the fact that for the past several months we have been operating some of our eighteen-hour per day runs with one-man cars, while two-man cars were operated on them last year.

NATURE OF MECHANICAL TROUBLES EXPERIENCED

The mechanical troubles we have had with the single-truck one-man cars are as follows: The body pedestal springs have broken and we have been compelled to increase the size of the journal spring from $\frac{3}{4}$ in. to $\frac{1}{2}$ in. and the body springs from $\frac{5}{8}$ to $\frac{3}{4}$ in. Any further increase would make a rougher riding car. One broken truck frame near the yoke is the extent of our truck trouble. We have had difficulty with air line to braking cylinder cracking, due to movement or breathing of cylinder. On each car two to four main cross-members of the underframing have broken. We have increased the size of these I-beams from $5\frac{1}{2}$ to $7\frac{1}{2}$ lb. and we believe this will correct that trouble. All these troubles are due to overloading. Based upon our experience, we would recommend that the weight of the standard single-truck car be increased slightly, at least enough to take care of the strengthening of the I-beams and underframing. We would also recommend the use of a 16-ft. air compressor, two fare boxes for short fast-schedule runs, the installation of motormen's stools on converted cars, and in order to keep tobacco juice off the steps we would recommend the equipping of all cars with trapdoor cuspidor flush with floor, headlights of greater efficiency than those with which these cars are generally equipped, and proper curtain device to shut off the glare of the car lights from the operator's windows.

CHANGES MADE

We removed the folding seats near the doors because passengers insisted upon sitting by the operator and block-

ing the doorway. To give much needed aisle space at the entrance we have changed the first seat inside the door from a cross to a longitudinal seat. The sand boxes were all moved forward one seat ($28\frac{1}{2}$ in.) to get away from wheel wash, which change has eliminated the trouble caused by sand pipe clogging.

We have had no trouble with the operation of these cars through snow except with the fender tripping device. During at least one snow storm it became necessary to tie up all fenders on account of the snow. We are now about to place hand straps in all our standard Birney cars.

On our converted cars we took out the Peter Smith heaters and put in 12,000-watt electric heaters in addition to a 1,000-watt heater placed in each cab; the heaters in the interior of the car are controlled by thermostats.

Based upon our experience, we believe that provided the weight of the double-truck car is not too great and that the body and trucks have not outlived their period of usefulness, it is far better for the comfort and convenience of the passenger to convert a good double-truck car to a one-man car than it is to purchase single-truck one-man cars. The total cost for converting our double-truck cars (which included new seats, electric heaters, all the Birney safety features, general overhauling, and painting) was \$1,915 per car.

We find that most of the floors on the ten cars put into service in 1920 will have to be renewed during the year 1924. These are single floor cars.

In conclusion, we do not believe that the operator of a one-man car is overworked due to the performance of the functions of both motorman and conductor, but of course there is an increase in mental functions which should promote efficiency of the operator as regards safety and otherwise, for an idle man is an unsafe man.

We believe that in communities under, say, 75,000, the one-man car is the one thing that will help most to save the street railway facilities to the community served. In communities over 75,000 as a general proposition each one-man car substituted for a two-man car will add just that much to the welfare of the car rider and the employees in general and be indicative of good management. The saving effected might be applied to improvement of the conditions of track, overhead line, car equipment, or a wage increase or even a dividend.

We believe that if the cars are of the double-truck type, equipped with properly spaced upholstered seats, and if other consideration is given to the comfort of the passenger, and if the company's public relations are in good order, and if the trainmen and councils are properly sold on the idea of one-man operation and acquainted with the necessity thereof, there will be little if any complaint in any community where this operation is tried.

Auto Buses and Street Railways*

Legal Status in Pennsylvania Defined—Policy of the Commission Is Toward Supplementary Rather than Competitive Service

BY J. F. SHRADER

Attorney American Electric Power Company

THE public utility laws of the several states vary so much in their phraseology, scope and purpose that the conclusions reached in one state are apt to have, from a legal aspect, little weight as authority in another state. For example, in a number of states, including Illinois, the very important competitive service to the street railway of the taxicab has been held to lie outside the regulatory powers delegated to their commissions. In Pennsylvania, as is well known, certificates of public convenience are required for call and demand automobile service, and our commission has placed restrictions upon such service under certain circumstances effectively eliminating competition with existing facilities.¹ This discussion will be confined to the policies and conclusions arrived at under existing laws of the Commonwealth of Pennsylvania.

Strictly speaking, every transportation facility which is capable of depriving a carrier of a fare is in competition with that carrier. Such competition extends conceivably from the roller skate to the airplane and includes the bicycle, the horse-drawn vehicle and privately owned and privately operated automobiles, as well as jitneys, taxicabs and motor buses. Transportation which is purely private, although competitive, cannot be governmentally restricted or controlled in the interests of rail carriers in the furtherance of public convenience and necessity. Chairman Ainey of our commission as early as 1916 announced, with possibly a word of warning, the principle which must control the commission, using this language:

... losses which this or other railway companies may sustain cannot be weighed against the convenience of the public if at any time a better or more convenient form of transportation than that furnished by the street railway companies is offered.²

Thus the acceptability of the service to the riders, or a considerable number of them, is in the last analysis the governing factor and will eventually control the extent to which the existing carriers will be subject to competition, private and public. In the measure that the street railways may be able to influence this decision by superiority, convenience, completeness and cheapness of service, they will accomplish more toward elimination of competition than the government could possibly accomplish, because the railways can, while the government cannot, reach and affect strictly private transportation facilities.

The Public Service Commission of

Pennsylvania has adopted a non-competitive policy which has been judicially approved. This, of course, only extends to the carriers within the jurisdiction of the commission. Broadly speaking, these are common carriers for profit as distinguished from purely private carriers who may operate either gratuitously or for profit. In order to understand to what extent this protective policy of the commission may be anticipated, it is necessary to know exactly where the commission and the courts have drawn the line between common carriers and private carriers. It will also enable those contemplating inauguration of auto bus service in conjunction with rail service to determine to what extent they may expect competition with the proposed bus service.

COMMON CARRIER DEFINED

The public service company law³ defines the relevant terms thus:

The term "Public Service Company" when used in this act includes all street railway corporations, common carriers and also all persons engaged for profit in the same kind of business.

The term "common carrier" as used in this act includes any and all common carriers, whether corporations or persons, engaged for profit in the conveyance of passengers or property, or both, between points within this Commonwealth.

Our commission has held that the word "common carrier" as used in this law is used in its broad sense as comprehending all that comes under the common law definition, and is not restricted to such carriers only as are named in the statute.⁴ The question as to whether a given service falls within or outside the classification of a common carrier is a question of fact for the commission in the first instance.⁵

The Supreme Court of Pennsylvania in 1909, prior to the adoption of the public service company law, defined a common carrier thus:

Any one who holds himself out to the public as ready to undertake for hire or reward the transportation of goods from place to place, and so invites custom of the public, is, in the estimation of the law, a common carrier.⁶

A common carrier has also been briefly defined as "one who undertakes for hire to carry all persons indifferently who apply for passage." Whether a person is engaged in the business of a common carrier is not dependent upon the means employed for the carriage, fixed termini nor definite route. These are held to be but limitations which the carrier places upon himself beyond which he may not be compelled to go in the performance of the public service which he purposes to render.⁷

In approaching the question as to whether a particular service is or is not that of a common carrier, it has been held that it is immaterial what a man professes to do, or what he says he does not do, or what his charter authorizes him to do, but, rather, what does he do in fact.⁸ He actually does at least two things; he holds himself out to the public as ready and willing to perform a transportation service, and he actually carries some one somewhere. Judicial decisions fix the former of these acts as the most important in determining the common carrier status. If he holds himself out as ready and willing to carry people indiscriminately as they apply, for hire, within the scope of his undertaking, either as to destination, numbers, route or method he has classified himself as a common carrier. After that he may actually confine his carriage, either voluntarily or by virtue of the exigencies of the situation, to particular classes of the public, such as employees of a particular industry, without affecting his status as a common carrier.⁹

This holding out or invitation of the patronage of the public may be done by public advertisement, signs upon vehicles, signs upon fences, cards for general circulation, or bills and tags used in the business.¹⁰ It may be done by taking a stand in a public street or square and inviting the patronage of the public, either by sign upon the vehicles or by gesticulating to people as they pass by.¹¹ On the other hand, the keeper of a garage, who at his place of business hires motor cars upon individual bargains to those who come to him and apply, is not holding himself out indiscriminately in such a manner as to make him a common carrier.¹²

The law states that the carriage must be engaged in "for profit." "For profit" has been judicially construed as synonymous with "for reward" or "for hire." This excludes the case of all purely gratuitous carriage, or the case where the public is expressly excluded in the undertaking as well as in the fact of carriage. Thus it has been held that where a man confined his holding out and his actual service to five named persons, although he hauled them repeatedly and for hire, he was not a common carrier.¹³ Likewise, upon this principle, I assume a vehicle jointly owned by a number of individuals and operated expressly and exclusively for the benefit of the owners, not for profit, and from which the public is actually excluded, would be held not to be a common carrier. The commission and the courts may be depended upon to discover and control any competitive service which, while in fact that of a common carrier, is conducted in a manner

calculated to make it appear like that of a private carrier.

An attempt was made in this state by a carrier to evade classification as a common carrier by limiting his passengers to current members of a "Community Auto Club." The qualification for membership in this club was the payment of \$1, upon the payment of which the members received seven tickets as a gift, each of which was good for one ride. After these seven tickets were used the members could continue to ride by the payment of 15 cents cash fare or the purchase of additional tickets at the rate of seven for \$1. This carrier contended he was not subject to the jurisdiction of the Public Service Commission upon the ground that all his passengers were carried under a special arrangement upon individual bargain. The commission found this special arrangement to be in the nature of a subterfuge, designated the service as that of a common carrier and issued a cease and desist order.¹⁴

It would seem that the practice of an automobile operator of rendering a service of carriage without exacting or demanding any particular fare but depending upon such reward as the passengers may see fit to give him, and where he holds himself out as ready and willing to carry all who apply for transportation, should likewise be held to be a mere subterfuge and effort to make an undertaking actually engaged in for hire or for profit or reward appear to be a gratuitous service.

CONVENIENCE AND NECESSITY DEFINED

The convenience and necessity of automobile carriage supplemental to the service of established rail carriers has, however, been repeatedly recognized by the Public Service Commission in this state and certificates for such service granted. We have endeavored to point out that above and beyond all power of the commission, although disposed to do so within proper limits, to restrict or control or direct the course of development of public carriage, there is the final factor of public demand which must prevail. This demand, sufficiently asserted, becomes a public necessity. It is not what the Legislature or the commission or the street railways or any individual thinks should be adequately sufficient service, but rather what a sufficient number of individuals in the community want and are willing to pay enough for to make operation possible that will finally determine the manner by and extent to which existing service facilities must be supplemented or extended. There is in every community in normal times a drift or trend of development and a shifting of population to new locations. Every new settlement must have its beginning and normally its growth is extended over a considerable period of time. There must be a period of time before it reaches a size which would warrant rail extensions when the residents, so far

as the rail service is concerned, are actually inconvenienced in some degree in their transportation. The public demands supplemental service and in its present frame of mind finds auto-bus transportation satisfactory and convenient.

SUPPLEMENTARY OR COMPETITIVE SERVICE

The question arises whether the public convenience and necessity may be better served by permitting such supplemental service to be conducted by independent carriers or by carriers in some manner controlled by the street railway companies. The Public Utilities Commission of the District of Columbia in discussing this question has said:

In our opinion, there is a legitimate field for bus service, but this does not lie in the multiplication of lines or of vehicles reaching the heart of the city. It lies rather in providing service in extension of the street car lines into territory so thinly settled as not to justify the large investment necessary for street railway service. The bus lines should be feeders. They should create business and not rob the street railways of the just reward due their heavy investments for the public benefit. An exception to this principle arises when the existing street railway service proves to be inadequate and, for reasons either physical or financial, additional street railway lines cannot be created. In such cases, even in thickly settled territory, the obvious recourse is to bus lines; but, in the absence of legal objections, the best interests of the public will be promoted by causing such lines to be owned and operated by the street railway companies and to co-ordinate them with the car lines so that transfer privileges and other desirable joint relations may result.¹⁵

The Pennsylvania Commission, in approving the application for incorporation of an auto bus company organized by an electric railway company and in issuing a certificate of public convenience for operation of such auto bus service in a field where at least forty-five jitney operators were operating under certificates, said:

At best, and under the most exacting conditions of regulations, jitney service of the character of that rendered in Chester is transitory and unstable. Automobiles are usually employed which are not equipped as they should be for public conveyance; it is difficult to the point of impossibility to operate them with the regularity and safety or with the service efficiency of vehicles designed and constructed especially for public passenger service; and in many respects that are obvious passenger auto bus vehicles, properly equipped, are preferable and superior to the types of cars used as jitneys over city streets and public highways. The elements of greater responsibility for the rendition of adequate public service by an incorporated company, and of the permanence of such service, are also important factors.

And further:

Such extensions as may be necessary adequately to provide for the requirements of the city and adjoining territory will have to be assumed by the operating company as part of its public obligation. Properly rendered, auto bus service as an addition and supplement to existing trolley facilities, and operating in conjunction therewith, should afford more adequate and reliable transportation facilities than the city of Chester has heretofore possessed.¹⁶

Subsequently the approval of the incorporation and beginning of the exercise of the right to operate auto buses in the same territory was sought by an independent applicant. The bus company, incorporated by the traction company, had not yet obtained the necessary

license from the municipality, while the new applicant had such license. The Public Service Commission refused to approve the incorporation of the new company and stated:

The commission is still of the opinion that the contemplated auto-bus service can best be rendered as a supplement to the existing trolley service, and can best be operated in conjunction with the trolley system.¹⁷

Our commission seems therefore to have adopted a policy favoring the operation of automobile service supplemental to trolley service by companies identified with the street railway companies. In addition to the likelihood that such operation will better serve the convenience and necessity of the public, from the viewpoint of the street railways themselves, distinct advantages would seem to result therefrom. Among other advantages which may suggest themselves to practical street railway men I would suggest the following:

1. It prevents outsiders from acquiring prior rights in territory naturally to be served by the street railway company. It is possible that such prior rights may at some future time arise to embarrass or impede the street railway company, either in the extension of its street railway lines or in the inauguration of supplemental motor bus service. The superiority of the motor bus over the transitory and unstable jitney is recognized, and this means that the motor bus will in all likelihood generally supplant the jitney. The motor bus involves a larger initial investment and will therefore in all likelihood be identified with more responsible and dependable owners. Such owners may not be so readily eliminated from the field by the buses controlled by the street railway companies.

2. Motor bus service so conducted identifies itself with the street railway service, as a part of it, and thus is a traffic feeder for the trolley cars at the same time that it tends to create a complete, satisfactory and acceptable transportation service, all of which, as has been previously pointed out, contributes fundamentally to the permanence and value of street railway investment.

3. It is well known that, despite the diligence of established carriers and of the Public Service Commission, irresponsible automobile operators do as a matter of fact, to some extent at least, compete with the rail carriers, either by failure to obtain certificates of convenience or by persistently exceeding the rights granted them. Such competition would be eliminated by motor buses operated in connection with the street railways.

4. It would prevent the diversion of traffic from the rail carriers, naturally and geographically entitled to it, to other carriers.

5. It would furnish a more responsible and substantial and unified automobile service.

6. It may at some future time enable street railway companies by the extension

¹⁴Lehigh Valley Transit Co. vs. Bauder, P. U. R. 1921 D, 404.

¹⁵In re Washington Rapid Transit Co., P. U. R. 1923 B, page 328.

¹⁶In re Southern Pennsylvania Bus Company, Application Docket, Pa., No. 6720, 1922.

¹⁷In re Chester Auto Bus Line, P. U. R. 1923 E, page 384.

sion of the auto-bus service to abandon unprofitable branches or lines without objection upon the part of any one.

7. It will insure the fixing of automobile transportation rates upon a scientific basis and to this extent eliminate an unfair and unfavorable comparison of rates as between motor bus and street railway carriers.

The increasing demand upon the part of the riding public for automobile transportation cannot, in my judgment, be safely ignored by the street railway companies, and it may possibly be that the motive of self-preservation may eventually force all street railway companies into greatly enlarged supplemental auto-bus transportation.

Accounting for Operating Expense and Depreciation

This Topic Considered in Report of Committee on Public Utility Rates at This Week's Convention of Railway and Utility Commissioners—
Separate Fund Recommended for Depreciation Reserve

IN ITS report at the convention of the National Association of Railway & Utility Commissioners at Miami this week the committee on public utility rates said that previous reports of this committee have dealt with the fundamentals of rate making, such as valuation, depreciation and rate of return, and, as was pointed out in the report of the 1921 committee, valuation has received so much publicity that there has arisen the quite common view that valuation is an end in itself. The report at the Miami convention this week was given up largely to the subject of desirable regulations for the expenditure of a depreciation reserve fund, with some introductory references to the importance of accurate accounting of operating expense, to which attention had been called in the 1921 report. Thus, the report says that donations to educational and charitable institutions are not a proper charge for operating expenses. To allow them would be to make the ratepayer the real donor. In Alabama a federal judge, in a recent case, had allowed as an operating expense a contribution of \$500 by the utility to the campaign fund of a candidate for the City Commission where the utility is located. An appeal on this has been taken by the state commission.

While the committee considers legitimate advertising as unquestionably a proper item to be allowed as an operating expense, it points out that utility advertising managers are not infallible and are liable to error especially if no questions are asked and their mistakes are passed on to the rate payer. If regulation is to take the place of competition for public service corporations, then regulation, while not infringing upon management, must know that management is honest, efficient and economical.

RESERVE FOR DEPRECIATION

This section of the report was written by E. R. Hughes of the Oklahoma Public Service Commission. An abstract follows:

Much has been said and written within the past few years on the maintenance of what is commonly called "the reserve for depreciation." Some have taken the position that such a

reserve is entirely unnecessary and therefore unjustified. Others, who have recognized the necessity for such a fund, have held that it may be used by the utility affected in such a way and for such purposes as the utility may see fit to put it. A number of the state commissions, including that in Oklahoma, have taken the position that any amount allowed for depreciation should be maintained as a separate fund and strictly accounted for, in so far as its use is concerned.

It has long been recognized that some amount should be allowed for the gradual waste of property used and useful in the rendition of a public service. This principle was enunciated very clearly by the Supreme Court of the United States in the Knoxville water case, and it has been set forth in numerous textbooks on the subject. The necessity for the creation of such fund and the allowance in the fixing of a rate of an amount sufficient to take care of the gradual wasting away of the property used in the public service being conceded, the most important consideration then is: How shall the fund so created be treated by the commission with respect to its maintenance and use?

It should go without saying, in the opinion of the writer, that when a public utility engages in the business of serving the public, it assumes a responsibility for keeping its means of service in such condition that the service will not be interrupted or impaired. Its property cannot be removed and established elsewhere so long as it is needed in the service being rendered, and it cannot be permitted to run down or get out of repair to a point where service is affected.

For the reason that it is not possible to meet the factor of depreciation from day to day or from year to year, the full serviceability of the utility's property can only be maintained where there is provision made against the time when retirement or replacement can be made. This provision must be financial in its nature and must be reasonably liquid so that its use when needed will not be unduly delayed. It must be reasonably adequate in amount, and should be, as has been repeatedly asserted by various state commissions,

fully protected at all times. From the nature of the obligation which rests upon the utility, the provision of such a fund is as much a part of the utility's property as any physical unit in it, and when provision is made therefor it renders the immediate physical conditions of the property relatively unimportant for the reason that whatever may have gone from the physical property through use is represented in a ready financial ability to retire or replace when necessary.

It is true that the consumer pays only for the commodity which he has received in the way of service, but it must not be overlooked that under regulation under the ordinary and usual conditions the concern supplying the commodity is in fact a monopoly enjoying the exclusive privilege and right of engaging in the business undertaking, and under usual and ordinary conditions the consumer is entirely dependent upon one concern for the supply of that commodity which, in many instances, is practically a necessity. He therefore looks to the regulating authority to see that all reasonable measures are taken to insure in so far as possible a continuation of the supply of the commodity and the continued rendition of uninterrupted and unimpaired service.

THE OKLAHOMA ORDER

These considerations induced the Oklahoma commission in 1921 to conduct some hearings on the subject and in 1923 it issued an order based largely on that used by the Indiana Commission in several specific rate orders made by it. A summary of the material provisions of the Oklahoma order is as follows:

"1. That each and every public utility company operating within the State of Oklahoma shall, on and after Feb. 1, 1923, create, provide and maintain separately a depreciation reserve fund, into which shall be placed all the moneys allowed and earned for depreciation.

"2. No public utility company shall be permitted to pay out in dividends any sum in excess of 8 per cent of the record value of its property used and useful in rendering service until after the full amount of allowed depreciation shall be paid into the depreciation reserve fund of such company.

"3. That said fund shall be handled and accounted for entirely separate and apart from the other ordinary funds of such utilities.

"4. That such depreciation reserve shall be held strictly in said fund and shall only be used in the following way and for the following purposes, to wit:

"(a) For meeting depreciation.

"(b) For investment in government or other high grade listed securities to be held strictly in said fund, and which shall return to said fund not less than 4 per cent per annum, or

"(c) Any such utility may borrow from its depreciation reserve fund for a period not to exceed three years an amount equal to the cost of any new

construction, extension or addition to the property—items chargeable to capital account—but as security to said fund there shall be deposited in same the utility's own bonds or the notes of such utility bearing interest at the rate of not less than 5 per cent per annum, which interest shall accrue to said fund.

"5. In handling such fund the utility will be held strictly accountable for its safe investment, for proper administration and accounting. Said accounting shall be double entry with the asset account designated 'depreciation fund' and the liability account designated 'depreciation reserve.'

"6. Each annual report filed by any public utility company shall set out clearly the exact conditions of said fund, showing clearly all additions to or deductions from this fund during the year covered by such report, the balance of said fund at the close of the year, and how invested."

The provisions of this order are not so drastic as many of the commissions of the United States have seen fit to adopt in connection with depreciation reserve requirements. It was sought to make the order sufficiently elastic and broad to cover all classes of public utilities, as well as to meet the different and varying conditions under which the different utilities were operated.

The great difficulty which confronts a regulating commission in this matter is usually the fact that after an allowance has been made, in the fixing of a rate for depreciation, in addition to the amount allowed at interest upon the investment, a great many utilities have taken the amount allowed as depreciation and capitalized it in property, to be used in connection with the service rendered, or have paid out the amount so earned in the way of dividends to the stockholders. The result of this practice is that when the time arrives when a continuance of public service depends upon replacement of property, used in the service, that such utility then applies to its commission for an additional rate based upon that necessity. The patron of the utility, having once paid into the coffers of the company, is again required to pay in the way of an advanced rate for that for which he has already paid once.

This question has been considered in numerous cases by commissions in the United States and the position of the Oklahoma Commission is in line with the decision of the Supreme Court in *Railroad Commissioners vs. Cumberland Telephone & Telegraph Company*, 212 U. S., 414, where the court, after saying that money collected for depreciation should not be so used as to add to the capital account, pointed out that this was not a case where there were surplus earnings after providing for depreciation fund, and the separate earnings were invested in extensions and additions. This distinction is a very important one to be remembered by the various commissions. In the *Cumberland* case also, the court declared that the burden of proof, after showing where the depreciation reserve fund was

expended, rests upon the utility and not upon the commission.

In conclusion, the commissions of the country should closely scrutinize the operating conditions of the utilities regulated by them with a view to seeing that revenue paid into the treasury of the company for the purpose of guaranteeing continued rendition of service is not dissipated by the paying of exorbitant dividends and is not cap-

italized without a strict account of the fund raised by this method by the utility.

The full committee on public utility rates, rendering this report, was Frank D. Morgan, Alabama, chairman; E. R. Hughes, Oklahoma; A. A. Betts, Arizona; J. M. Thompson, Idaho; Henry C. Atwill, Massachusetts; William J. Smith, Illinois, and Porter Dunlap, Tennessee.

Utility Policies Discussed

Association of Railway and Utility Commissioners Consider Regulatory Measures at the Miami Convention

THIS week the National Association of Railway & Utilities Commissioners is holding its annual meeting in Miami, Fla., and an extended program of addresses and committee reports is under consideration. Those from whom addresses are scheduled include representatives of the American Electric Railway Association, National Electric Light Association, American Gas Association, American Railway Association and Interstate Commerce Commission. A few of the committee reports have been received in time for brief reference in this issue. One on public utility rates is printed in rather extended abstract in another column. Abstracts of some of the other reports follow:

The report of the committee on service of public utility companies was devoted largely to a consideration of the New Jersey situation of last summer, when there was no trolley service for fifty-one days in 142 municipalities, representing a total population of more than 1,000,000 inhabitants. According to the report, the situation which began with the strike of the employees became a strike against the public on the part of the company, which adopted a policy of "Agree to our plan or no service will be offered." Legal measures under which the company was required to begin service are described. The report, in defending the position of the court of equity of New Jersey in the case, cites the possible case of a water company which desired to increase its rates or relieve itself of other economic burdens and announced that it would withdraw all water service until the public officers and the public at large consented to its plans. But little imagination is needed, the report says, to point out the disaster to any large city if its water supply were cut off entirely for a period of fifty-one days. The report continues:

The law should never be without a remedy under such conditions, and that remedy should be one that should immediately be effective and should not be surrounded by any of the ordinary delays incident to legal procedure.

The action of the company in New Jersey in withdrawing its service in its entirety was at once a challenge to the sovereignty of the state. Its success would have defeated all regulation. It would have nullified all laws and the supreme power of the state over its citizens and corporations. It would have pointed out to all utility companies that relief as to rates and to any other economic condition could be brought about by any company

by simply withdrawing its entire service until its terms were met by the public. We express the doubt that nowhere since regulation became a part of our political institutions has any great public utility attempted to establish such a precedent.

In its recommendations the committee declares that in every state where regulation is effective steps should be taken and a proper legal machinery be provided to prevent a situation of this kind ever becoming effective, and that the franchise obligation to serve shall always be construed to mean continuous and uninterrupted service. The report was submitted by J. J. Divine, chairman of the West Virginia Commission.

GRADE CROSSINGS

The report of the committee on grade crossings and trespassing on railroads contains a table showing the apportionment of the cost of eliminating grade crossings in the different states, when fixed by statute. The report declares that the time has come when in some form the automobilist should specifically be required to share in the expense which has usually been divided between the railroad and the public. The proportion suggested is 40 per cent for the public, 40 per cent for the railroads and 20 per cent for the automobilist, and the suggestion is made that this 20 per cent might possibly be obtained by diverting the fines imposed upon automobilists for reckless driving into a fund for this purpose. The report, which was submitted by W. T. Gunnison, New Hampshire, chairman, also suggests that to compel automobilists to slow down at crossings obstructions might be placed in the highway.

Central Traffic Men Meet

AT A meeting of the Central Electric Traffic Association in Cleveland, on Nov. 21, the committee on prevention of freight claims recommended that all waybills covering inter-line shipments be placed in a large waybill envelope and carried outside the car rather than inside the car with the shipment.

The association also decided to advertise the lines of the Central Electric Railway Association territory in the *Traffic World*, the amount of space to be contracted for depending on the number of companies which are willing to participate in this advertising.

Pennsylvania Men Discuss Bus and One-Man Cars

TWO very practical papers, one on the use of motor buses by street railways, by J. F. Shrader, and the other on one-man car operation, by W. H. Boyce, were the features of the annual meeting of the Pennsylvania Street Railway Association held at Harrisburg, Pa., on Dec. 4. The convention was limited to an afternoon and evening session only, but the attendance was larger than usual, being about 100 altogether. In the absence of President C. B. Fairchild, the meeting was presided over by Vice-President F. R. Phillips, Pittsburgh Railways.

The electric railway men were greeted by Governor Pinchot, who said that he was glad to say that the street railways had recognized their duty to the public, which cannot be said of all other public utilities, as, for example, the anthracite industry.

The papers presented by Mr. Shrader and Mr. Boyce appear elsewhere in this issue. John P. Dohoney of the Pennsylvania Public Service Commission sent a brief communication to the convention on the subject of safety, in which he commented that in a period of ten years there had been only four street car passengers killed as a result of crossing collisions in Pennsylvania. He said that this marvelous record reflects the precaution that is exercised in crossing movements and is made more notable by the fact that trolleys are operated over 611 crossings, 310 of which are on main lines.

Major Otto Rau addressed the meeting briefly on "The Giant Power Survey." Major J. S. S. Richardson, director of the Pennsylvania Public Service Information Committee, presented a paper reviewing the history of the development of the state information committees and outlining the plan of their work and the accomplishments of the Pennsylvania committee in its brief existence.

The convention passed a resolution indorsing the tax reduction plan of Secretary Mellon. Further business was the decision to appoint a committee to investigate the possibility of legislation to permit railways to operate trackless vehicles under their present charters. The executive committee was authorized also to appoint a permanent committee to co-operate on the giant power survey.

The new officers elected for the ensuing year were as follows:

President, F. R. Phillips, acting general manager Pittsburgh Railways; vice-president, W. S. Bell, general manager Wilkes-Barre Railway; secretary and treasurer, H. M. Stine, Harrisburg, Pa. The executive committee will consist of Messrs. Phillips and Bell and Gordon Campbell, C. L. S. Tingley, Thomas Cooper, C. F. Crane, and C. B. Fairchild.

At the evening banquet short speeches were made by several people.

Edward E. Beidleman, former Lieutenant-Governor of Pennsylvania, expressed the belief that the pioneer investor deserves a greater return on his money than the man who takes no chances, and that new capital cannot be secured for future pioneering enterprises if the return is too rigidly limited. In other words, he disapproved of the limitation of railway earnings to the so-called fair return of about 6 per cent.

Kentucky Utilities Meeting Postponed

THE annual meeting of the Kentucky Association of Public Utilities, scheduled for Dec. 13 and 14 has been postponed to Jan. 10 and 11, 1924, according to an announcement from Edward F. Kelly, secretary.

American Association News

Midyear Meeting Program

AT THE meeting of the committee on subjects and meetings of the American Association, held in New York on Nov. 27, it was decided to make the city traffic problem the topic for the morning session of the midyear meeting, which will be held in St. Louis, Mo., on March 4, at the Chase Hotel. Traffic will be discussed from various standpoints including those of municipal authorities, motor vehicle interests and electric railways, with the idea of co-ordinating all interests in working toward better conditions.

It was decided to devote the afternoon session to the subject of finance, with three principal speakers, one a banker, one an economist and the third a holding company representative.

There will be the usual banquet in the evening with a speaker of national prominence closely associated with the administration in Washington, and one other speaker, of public prominence.

The members of the subjects and meetings committee present were Chairman Frank R. Coates, Gen. George H. Harries, Harlow C. Clark, J. K. Punderford, F. W. Doolittle, W. H. Hyland, Cornell S. Hawley, Harry L. Brown, E. H. Reed, representing E. M. White, and J. W. Welsh.

Extra Mail Pay

THE Post Office Department in circular letter R-A-514, dated Nov. 23, issued by the division of railway adjustment, office of second assistant postmaster-general advises that the department will pay for emergency mail service duly employed on and after Dec. 1, 1923, as supplied by the urban and interurban electric railways. L. H.

Palmer, chairman of the committee on mail pay, interprets this to be largely to take care of the Christmas business, although it would apply at any time of the year when for some exceptional reason excess mail moves.

Heavy Electric Traction

THE first meeting of the heavy electric traction committee of the Engineering Association was held at New York Dec. 6. It was voted to revise and bring up to date the bibliography of heavy traction and electrification data, rearranging it in such form as to be more readily accessible. It was proposed to limit the number of periodicals indexed to approximately twenty-five of the leading American and foreign journals. The subject was referred for further study to a sub-committee, of which H. F. Brown is chairman.

The subject of self-propelled cars and storage battery locomotives was discussed. It was felt that information on this topic would be of importance not only to the steam railroads, but also to a certain number of interurbans which might require extensions in territory where an electric line is not justified. It was the sense of the committee that the topic should include self-propelled locomotives as well as motor cars. The subject was referred to a sub-committee, J. H. Davis chairman.

The subject of articulated trains was referred to a sub-committee headed by J. J. Sinclair.

There was some discussion regarding the subject of couplers for train service. The entire matter, including the proposed manner of treatment, was referred to a sub-committee, with A. H. Daus as chairman.

Those present at the meeting were J. C. Davidson, chairman; A. H. Armstrong, A. H. Candee for H. W. Cope, H. F. Brown, J. H. Davis, E. P. Chase for J. V. B. Duer, Norman Litchfield, L. S. Wells, J. J. Sinclair, A. H. Daus and Morris Buck.

Special Reports Available

THE Bureau of Information and Service of the American Electric Railway Association announces that the following special reports have been prepared and are available to member companies in good standing upon request:

Trend of Material Prices: A new edition of the association's compilation bringing down to date the trend of prices of materials used by electric railways as furnished by manufacturers.

One-Man Car Operation: A summary of the replies of over 200 companies to the association's questionnaire, showing the number and types of one-man cars operated, fare collection methods, accident record and the attitude of the public toward operation with one man.

Accident Statistics of Electric Railways: Comparative record of 113 companies for the years 1920, 1921 and 1922, showing number and cost of accidents, causes of the more frequent types of accidents and comparisons on unit basis to show the general progress in accident prevention.

In addition to the above, supplements to the Wage Bulletin, Fare Bulletin and Cost of Living Studies have been prepared bringing them down to date.

Maintenance of Equipment

Improved Type of Resistor Mounting

BY H. S. WILLIAMS

Assistant Superintendent of Equipment,
Department of Street Railways,
Detroit

LAST season so much trouble was experienced with comparatively new equipment on the lines of the Detroit Municipal Railway, due to

Sections and Plans of Method of Mounting Resistors

grounded resistors, that radical steps had to be taken to correct the inherent weakness of the method employed in mounting. This original method was the familiar scheme using two porcelain insulators and insulating sleeves at each supporting bolt, which plan is recommended by the large manufacturing companies. This scheme has proved unsatisfactory in that the leakage distances are too small. Of course, this trouble could be minimized if all the porcelain insulators were kept clean. This however, is impracticable because of the added cost of such care and the

fact that the upper porcelain is often very inaccessible.

The accompanying illustration shows the improved plan of mountings which has been adopted. This is essentially a combination of the method used many years ago with the latest recommended practice, but with added refinements. The mounting block which fastens to the car underframe is made as long as convenient. This is of oak, and, after fitting and drilling, it is prepared after the principles used in dipping and baking railway armatures. It is baked in an oven, dipped in linseed oil or insulating varnish, baked again and given a final coat of black air-drying varnish. This gives it a lasting moisture-proof character.

The next step is the application of the grid mounting bolts. These are galvanized carriage bolts countersunk in the mounting blocks, and the countersink is filled with a special insulating compound so as to prevent any leakage at this point due to moisture. This compound is further guarded by an impregnated wood cap. Definitely to avoid trouble from the turning of the carriage bolt head in subsequent maintenance, a special square grip washer is used.

Insulating sleeves and porcelain insulators are then applied. With two porcelains used together the leakage distance is increased so that no matter how much alkali, dust and moisture is present they will stand up. The transite heat guard is then applied and bolted in place. Up to this point the installation is considered permanent, which explains the extra precautions used as to detail. It is believed that with this plan carefully followed, the slight added expense is fully warranted and that resistance grounding will be entirely overcome. All wires to the resistance have the insulation removed from the connectors back to the top side of the transite board and the bare wire is tinned thoroughly. The same porcelains used in mounting are being tried out at the ends of the resistance grids in order to increase leakage distance at this point. An opinion on its efficiency cannot be given yet.

Old Rail Used to Support Car Stop Sign*

DURING the recent war the Northern Texas Traction Company, Fort Worth, inaugurated the skip-stop system on its city lines. It was therefore necessary to designate each stop by a car-stop sign. For this purpose was used a metal plate fastened to a vertical post made of an old rail sunk into the sidewalk.

All Car Stops in Fort Worth Are Marked by Signs of This Type

On all lines on which front-entrance one-man cars were used these posts were placed at the curb in such a position that when the car came to a stop the car-stop sign would be exactly opposite the front door. Similarly, on lines where rear-entrance cars were used the posts were located further from the street corner, so that the sign would be opposite the rear-entrance door of the car.

Installation of these signs has resulted in speeding up the service and a lessening of confusion among the boarding and alighting passengers. When additional stops were installed new signs were erected at all of the

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

new stopping points. Whenever double-truck two-man cars, with rear entrance, are replaced on any line by one-man front-entrance cars the car-stop signs are moved so that they will be in the proper position for the new type car.

New Cable Suspension Reduces Vibration

BY G. H. MCKELWAY

Engineer of Distribution Brooklyn-Manhattan Transit Corporation

A NEW form of suspension for high-tension triplex lead-covered cables has been worked out in Brooklyn to reduce the vibration where the cable is suspended from the elevated structure. In a number of places cable of this type is used where there is no underground conduit, and occasionally cables are run overhead on pole lines.

Originally the practice was to hang the cable directly from a messenger wire, which in turn was attached to the structure. The connection between the messenger wire and the cable was made by marline instead of by metal clips, since the elevated structure was used as a part of the return circuit. It was considered undesirable to permit any current to flow along the sheath of the cable, as this might cause damage by electrolysis. Some trouble was experienced due to cracking of the lead sheath, caused by vibration of the elevated structure whenever a train passed.

An improved method of construction was adopted to remedy the difficulty. A suspension wire is attached by U-clamps, which run through the flanges of light I-beams bolted to the girders. A second messenger wire is hung from this suspension wire by U-bolts attached at intervals of approximately 10 ft. The lead cable is suspended from the lower messenger by marline, the wrappings of marline being spaced 1 ft. apart.

Steady braces are provided on curves where there is danger of the cable being pulled against the elevated structure. These consist of pieces of strap iron bolted both to the girder and the lower messenger wire. This improved method of suspension has reduced the troubles from cracking of the lead sheaths considerably. Vibration is not entirely eliminated, but by careful inspection at frequent intervals cracks can be located and repairs made before moisture can enter to damage the insulation.

Bevel Gears Improve Door Operation*

THE Northern Texas Traction Company, Fort Worth, has found the use of bevel gears in place of toggles and rods for door and step operation to be a great improvement. These gears are installed on the lower end of the door rod, as shown

This Bevel Gear Arrangement Has Given Satisfaction on the Cars of the Northern Texas Traction Company

in the accompanying illustration. Their use reduces the amount of door and step rigging by half and makes it possible to adjust the mechanism with a single movement. Door and step trouble has been greatly reduced, and the operation from a transportation standpoint is much more satisfactory than with the older type apparatus.

Long Wear Platform Flooring

THE Chicago Surface Lines recently made a careful investigation of the construction of platform floors on its cars for the purpose of reducing maintenance costs.

These floors have heretofore been made of single $\frac{3}{4}$ -in. hard maple boards, $3\frac{1}{2}$ in. wide. It was found that it often became necessary to renew flooring because of the splinter-

Special Tongue and Groove Arrangement for Increasing Life of Flooring

ing of the boards at the tongue and groove joint as the upper surface became worn. In many cases the floor still had ample strength but was replaced on account of its poor appearance.

The arrangement shown in the accompanying drawing has been

adopted to increase the life of the flooring and also to avoid the unsightly appearance of open cracks. The tongue and groove are cut as near the lower surface as practicable, thus giving a wearing depth of $\frac{3}{8}$ in. from the upper surface. The lower face of the tongue is cut almost at right angles to the edge of the board, while the upper face is sloped down at a sharp angle. Consequently when the flooring becomes worn down to the edge of the groove the resulting crack in the joint does not become unsightly until all of the useful life has been obtained.

Emergency Valve Used as a Quick Release Valve*

ONE of the principal advantages of the Birney car is its extremely rapid acceleration, and when a question of converting the large double-truck cars of the El Paso Electric Railway into one-man type came up, there were many who did not believe that they would be able to make the time with them, particularly during the rush hours. The air equipment on these cars was the Westinghouse SME with the "D" emergency valve. The release on this valve was very slow, and would not make for quick acceleration. The valve was studied with the idea of converting it into a quick-release type, with final success.

The emergency valve was left in its original place, the emergency line was removed and the emergency port leading to the bottom portion of the valve was plugged and the emergency valve taken out. The main reservoir line was left in its original position, the straight air line from the "D" emergency valve was connected to the brake cylinder line on the K-1 emergency valve.

By making this change, not only

was the quick acceleration obtained, but also much quicker brake action, thus obtaining more rapid operation and better conservation of equipment.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

New Equipment Available

New Model Underfeed Stoker

THE Westinghouse Electric & Manufacturing Company announces the development of a new multiple retort underfeed stoker. This is sold in all the usual sizes and includes double and single dump

tively low for any condition. The damper frames are steel and cast iron set in the concrete floor of the wind box. The main and division dampers are made of steel plates with angles. Each damper has its control conveniently mounted in front of the stoker.

The new ash discharge device or

Interior View of Stoker Showing Ash Discharge Device

grates, also double and single roll ash discharge devices. A new development in positive control of the contour of the fuel bed has been added, also another new feature of this stoker is the agitating element. This provides a means of maintaining minimum loss due to combustible in the refuse. The experimental installation of this type of stoker in Minneapolis was treated at length in this paper, in the issue of Aug. 12, 1922, on page 221.

The movement of the secondary ram is counter to that of the main ram. The motion agitates the fuel beds as the rams approach and recede from each other, thus uniformly distributing the fuel. The secondary rams are actuated by connecting rods from the main ram. The travel of the individual or group of rams is varied in increments from no travel to full travel. The action of the agitating grate is provided by a steam or air cylinder controlled by a pilot valve mounted adjacent to the side furnace door.

The wind box is beneath the stoker and is exceptionally large. The dampers are rectangular and of large area, hence the air velocity through the damper frames is rela-

tively low for any condition. The damper frames are steel and cast iron set in the concrete floor of the wind box. The main and division dampers are made of steel plates with angles. Each damper has its control conveniently mounted in front of the stoker. The new ash discharge device or

clinker grinder which has been developed can be applied to any Westinghouse underfeed stoker. The construction provides for four walls which are relatively vertical, assuring positive discharge of the refuse into the deep pit, where the large rolls dispose of it. The front and rear walls are built of heavy sectionized cast-iron plates of uniform thickness. This provides for expansion and contraction without cracking. The large square forged-steel shafts are incased in heavy sectionized cast-iron rolls and are supported by massive bearings.

Heavy Duty Pipe Cutting Machine

Roller Pipe Cutting Machine

THE Geist Manufacturing Company, Waynesboro, Pa., has placed upon the market a high-production heavy-duty roller pipe cutter. The design of this machine embodies features which have eliminated certain weaknesses found in other machines of this type.

This machine is made in one size, having a range from $\frac{1}{8}$ in. to 2 in. inclusive.

It is compact and rigid in design. All spindles and shafts are ground and run in bronze bushed bearings.

The cutter is made from tool steel and is heat-treated to give the maximum wearing qualities. It can be reground when dull. The cutter shaft bearing is provided with an adjustable cap on the cutter side for taking up any wear which may occur.

The rollers are made from tempered tool steel and are carried in roller bearings. The cage which supports the rollers is elevated to the cutter by a cam operated jointly by a pedal and a lever. The sliding surfaces of the cage are protected from scale and dirt by a flexible guard. The rollers are adjustable for the different sizes of pipe. This adjustment is obtained by means of a hand wheel located just below the rollers. The lever and the pedal can be positioned to suit the operator. Their movements are limited by an adjustable stop. A small cage of rollers for $\frac{1}{8}$ -in. to $\frac{3}{8}$ -in. pipe can be attached to the large cage without removing the regular rollers.

The length gage is adjustable for the different sizes and lengths of pipe. It will gage lengths of pipe up to and including 4 ft. The parts coming in contact with the revolving pipe are hardened to resist wear. The gage arm is a heavy casting.

The News of the Industry

North Shore Rights Through Chicago Disputed

Corporation Counsel Believes High-Speed Interurban Has Exceeded Its Rights

An opinion was recently delivered to the City Council of Chicago by the corporation counsel holding that the Chicago, North Shore & Milwaukee Railroad is operating passenger, merchandise dispatch, express and freight service over the Northwestern and South Side "L" lines within the city limits without legal rights. This opinion is the result of an order passed by the City Council which declares that the North Shore Line is operating within the city without franchise and requires that it be compelled to stop its trains at all stations or get off the right-of-way of the "L" lines altogether. The city law department contends that the franchises of the two "L" lines do not give these companies the right to grant trackage rights to the North Shore Line.

HISTORY OF THE CASE

According to the legal department of the North Shore Line, this company operates over the "L" tracks under a statute of the State of Illinois which provides that one railway property may lease trackage rights over another railway property, even though such rights are obtained under protest. A city ordinance, however, does prevent certain steam road equipment from being operated over the elevated structure. This ordinance has not been violated by the North Shore Line because no attempt has been made to operate other than electric railway equipment.

In July, 1907, the City Council of Chicago passed an ordinance authorizing the Chicago, Milwaukee & St. Paul Railroad to electrify that part of its Evanston Division lying between Irving Park Boulevard and the city limits on the north. The ordinance provided that trains be operated electrically, either by the St. Paul company or by the Northwestern Elevated, but that in either case passengers should be carried from all stations within the city limits to all stations on the Union Loop without change of cars.

In 1910 the City Council passed an ordinance requiring the St. Paul company to elevate its tracks from Montrose Avenue to the north city limits, but no construction work was done then. Later the Chicago, North Shore & Milwaukee Railroad desired to get entrance over the elevated structure into the Chicago Loop. The St. Paul Railroad was willing to lease its right-of-way from Wilmette, a suburb just

north of Chicago and Evanston, to Montrose Avenue to the North Shore Line, provided the Northwestern Elevated would surrender its contract made in 1907. The St. Paul company was ready also to elevate its entire right-of-way for additional tracks, provided the North Shore Line would undertake to handle electrically the freight business of the St. Paul Railroad along the lake shore in Chicago and pay interest on the capital expenditure for such track elevation.

The North Shore agreed to assume these obligations if the Northwestern Elevated would surrender its 1907 agreement and permit the operation of trains of the North Shore Line over its track to the Union Loop and over the lines of the South Side Elevated to Twelfth Street. A joint operating agreement was entered into which rendered inoperative the agreement of 1907. The lease from the St. Paul Railroad was made to the North Shore Line, which is financially responsible to the St. Paul for all obligations, the Northwestern Elevated guaranteeing the performance of such obligations.

In this agreement the Northwestern Elevated, as between it and the North Shore Line, assumes all the lessee's obligations and in return gets the lessee's share of the benefits accruing from the lease, the North Shore Line reserving certain specified track rights, for which it pays the Northwestern Elevated rental, based on car mileage. Without the additional security given by the North Shore Line, the St. Paul would not have elevated its full right-of-way, so as to provide four main tracks for express service to the city limits instead of two as required by the 1910 ordinance. The continuance of service by the Northwestern Elevated north of Wilson Avenue is thus claimed to be directly dependent upon the performance of its obligations under the agreement, including the obligation to let the North Shore Line use its tracks to the Union Loop.

This lease and operating agreement was approved by the Illinois Public Utilities Commission in an order entered May 28, 1919, after a public hearing. On the plea of business men on the South Side, the Illinois Commerce Commission on Nov. 2, 1921, made an order extending the service of the North Shore Line to Sixty-third Street and Dorchester Avenue on the South Side. At both commission hearings the city was represented.

These agreements are said to be in strict accord with the ordinances of 1907, whereby the North Shore Line pays the city of Chicago an annual license fee of \$50 per car for each car operated over the elevated lines.

One-Man Cars Still Operating in Oakland

City Seeks Aid to Raise Funds to Install Municipal Bus System—Railway Makes Offer

Resort will probably be had to the ballot in connection with the one-man car dispute in Oakland, Cal. The question of voting bonds to provide funds for municipally operated buses will be put up to the voters just as soon as the provisions of the initiative measure have been met. To this end the public is being asked to sign petitions, and as soon as the requisite number of signatures has been obtained the question of voting the bonds will be put up to the City Council.

What the voters will do if the question ever reaches them is, of course, problematical, but it would seem unlikely that the public will vote to discommode itself by paying an extra fare to ride in city buses, although it has been promised that the city buses will be run with a 5-cent fare, as against the 6-cent fare now being collected by the railway.

The San Francisco-Oakland Terminal Railways, which operates the local Oakland lines, has declared the proposed ordinance "unreasonable and therefore void." Aside from the merit inherent in the company's case in the present controversy its position is strengthened by the fact that a large part of its rush-hour traffic is carried across the bay in the company's own ferryboats and that most of the passengers thus carried transfer to the company's local trolley lines and to its high-speed suburban trains.

In the meantime, the one-man cars continue to be operated despite a city ordinance, but with the approval of the Railroad Commission. There are fifty such cars in use, although some of the larger ones are being run with two-men crews, replacing other cars, which have been sent to the shops. Threats of police action have been repeatedly made against the company by the city officials, but to Nov. 27 there has been no action along this line.

As far as public sentiment about the bus is concerned it seems to be divided. Buses are favored generally as feeders for outlying districts, but there is growing opposition to them in the more congested sections.

The railway itself is the latest to make an offer to run buses. It has filed with the City Council of Berkeley an application to operate buses in that city at a license fee of \$60 a year for each bus. This offer has been referred to City Manager Edy for his investigation and report.

The controversy in Berkeley antedates the one in Oakland by a month or two. That city passed an ordinance prohibiting one-man cars and the measure has been respected. One-man cars are not operated within the limits of that city.

In Alameda, too, there is a controversy. It is somewhat different from the others. In that city both the Peerless Stage Company and the railway have offered to run buses. The railway seeks to use the buses as feeders to its trolley lines, but the stage company wants to run buses on regular half hour schedules between Alameda and Oakland. This situation is made truly complex by the fact that the stage company has been refused a franchise in Oakland, the city officials of which desire to run a municipal bus service.

To date the only city run bus in Oakland is the Rosalie. It has been in service since the latter part of October, first on one run and then on another.

The one-man car controversy at Oakland really became acute in August when the company put into use with the approval of the State Railroad Commission a number of one-man, two-man cars. Previous to that time cars of the Birney type had been operated on Telegraph Avenue as far as Alcatraz. The only rumble against these cars came in the form of a protesting resolution passed at the national convention of the Amalgamated Association in Oakland early in September. These cars were only 25 ft. in length.

In August the one-man, two-man cars appeared and immediately the trouble started. Mayor John L. Davie, backed by Commissioner Moorehead, formerly business agent of the Oakland carmen's union, immediately prepared a resolution condemning the cars and then had the resolution passed by the City Council in the form of an ordinance.

Atlantic City and Suburban Strike Declared Off

A truce has been declared in the strike of the employees of the Atlantic City & Suburban Railway, Atlantic City, N. J., against restoration of the one-man cars. Full service on the company's lines has been resumed under an agreement between the company and the men that for one month two men will be placed on all cars, with the exception of the one run between Pleasantville and Absecon, where one man will operate a car during the slack hours. One-man schedules for periods of sparse traffic on other lines are to be put into effect later. The strike followed announcement by the company of the resumption of the use of one-man cars. The men held to their original contention that this operation was dangerous.

Residents of fifteen towns on the mainland, including Pleasantville, Bower's Point and Absecon, were affected by the tie-up. Mayor Charles Jackson of Pleasantville issued permits for buses to operate on the shore road between that city and Atlantic City to relieve the situation.

Franchise Amendment Vote \$1,500,000 to Be Spent by Ottawa Electric Railway if Residents Sanction Plan

Residents of Ottawa, Ont., will have an opportunity on Jan. 7 to vote on the proposal under which the Ottawa Electric Railway will carry out \$1,500,000 of improvements. The negotiations toward this end date back to last summer.

On Aug. 10 the Mayor wrote to the company asking under what agreement it would undertake the Feustel improvements and extensions, requiring an expenditure of \$1,500,000.

On Aug. 18 the railway submitted a proposal with certain changes, agreed to since the negotiations with the city's street railway committee. Stripped of the "judicial phraseology," in which it is now clothed in a legal document, the agreement is briefly this:

The old agreement of 1893, which has stood the test of thirty years, and was automatically renewed last August for five years more, is to continue in effect with the following amendments:

The company is to have an exclusive franchise to carry passengers within the city limits by street cars or buses operating on regular routes; such franchise not to prevent the operation of cabs, taxis, or buses from outside points.

The company is to have the right to operate a certain number of one-man cars on light traffic lines, with a guarantee that their introduction will not affect the position or seniority of any employee.

The Sunday and limited rates of fare are to be discontinued, leaving a straight 5-cent fare for adults and 3-cent fare for children, with no change in the old rate for school children.

At the end of the present five-year extension of the old agreement (August, 1928) if the company finds it cannot carry on with the 5-cent fare, it may appeal to the Dominion Railway Board to have the rate of fare increased for the next five years.

At the same time if the corporation thinks the company has been making more money than it should out of the 5-cent fare, the city may appeal to the same board to have the rate of fare reduced.

The judgment of the Dominion Railway Board on such appeals to be accepted by the city and the company as final.

Extensions that may be required for the five-year periods after August, 1928, to be settled by a board of arbitration.

These, in short, are the principal terms. The company points out that under the old agreement the city had the right to buy the railway in August, 1923. It did not do so. The old agreement stipulates it may do so at the end of any five-year period after August, 1923; the price to be set by a board of arbitration. The conditions of the old agreement are not changed, except as described previously. Under the

new agreement the city still has the right to buy at the same time and under the same terms.

Saginaw Transit Provides Service—Jitneys Disappear

Transportation service is now being furnished Saginaw exclusively by the Saginaw Transit Company, which was granted a franchise last June for street car-bus operation. The jitney buses that aided in the bankruptcy of the old Saginaw-Bay City Railway and later furnished all the local service since Aug. 11, 1921, have ceased to operate. They carried their last passengers on Dec. 1.

While complete city service is now being given by the new company, there is one car line yet to operate. The delay in steel shipments prevented the construction of the double-track switch and the territory that naturally would be served by that line is entirely dependent on motor bus service.

All of the bus equipment has been delivered and just as soon as the one railway route is ready the company will function under terms of the franchise.

Charles S. Kressler, general manager, is doing everything possible to give the proper service and it is generally believed that he will be successful. To ascertain the requirements of the city, a traffic flow census is to be taken of all manufacturing plants.

Mr. Kressler's recent talk to the merchants of the city when he pointed out the high costs of driving their own cars in preference to using the railway service has borne fruit and many business men now leave their automobiles in the garages and use the street cars or buses as the case may be.

In the future each car or bus will carry a neatly printed card bearing the name of the operator.

"Spreckels Day" in San Diego

At a luncheon of the Optimists' Club in San Diego Claus Spreckels told what the San Diego Electric Railway was doing for Greater San Diego. Mr. Spreckels called on his department heads to arise in turn and give an account of themselves and their activities. E. J. Burns, assistant general manager of the San Diego Electric Railway, referred to the construction work being undertaken by the railway and its resultant expenditures. The plan of the Optimists' Club is to entertain the department heads of San Diego's largest business concerns at a series of noon-day luncheons. This particular day was celebrated as Spreckels Day.

Subway Plans Ordered

Mayor Rolph of San Francisco has ordered City Engineer O'Shaughnessy to prepare plans and estimates for the Market Street rapid transit subway, saying it was proposed to submit improvements to the people at special elections to be held later. This was Mayor Rolph's first act after his re-election.

Employees to Purchase Securities

Will Create Purchase Fund Out of Wage Increase, Suggestion Made by Thomas E. Mitten

Employees of the International Railway, Buffalo, have voted to use the 2½ cents an hour wage increase granted by the company effective on Jan. 1, 1924, to create a fund for the purchase of securities of the company. Because of the low prices now quoted for the 5 per cent bonds and the common stock of the company, the employees consider that an unusual investment opportunity is presented by these securities.

The formation of the investment fund was suggested by Thomas E. Mitten, chairman of the board of the railway and president of Mitten Management, Inc., which has a contract for operating the International. The wage increase will total approximately \$200,000 a year and the employees have voted to divert this money to the purchase of the company's securities in their own interest. According to figures presented by Mr. Mitten the \$200,000 will at present prices purchase \$200,000, par value, of 5 per cent bonds of the company and \$1,000,000, par value, of stock. The return on the bonds will be immediate, but for the present at any rate the virtue of the stock will lie in the appreciation in its quoted price as the condition of the company improves. In fact Mr. Mitten said that any appreciation in the value of the stock rests largely on the successful operation of the property through co-operation of employees and employers. The bonds are now selling at \$50 for each \$100 par value and the stock is quoted at \$10 for each \$100 share.

In announcing the wage increase of 2½ cents an hour, Herbert G. Tulley, president of the International, explained that Buffalo paid during the first part of the year 2½ cents an hour more than the average wage of Rochester and Cleveland, but during the latter part of the year the basic wage was 2½ cents below, the result being that for the entire year the wage rate paid by the International has averaged the wages paid in these two cities. The Cleveland rate now is 60 cents and Rochester 55 cents, the average being 57½ cents.

Mr. Tulley said that while the company is not now actually earning sufficient money to pay the wage increase, square dealing with employees calls for wage readjustments whether they be up or down. In view of the fact that the Buffalo scale is based on the average of Rochester and Cleveland the directors decided to grant the 2½ cents increase, making the Buffalo rate 57½ cents an hour for trainmen.

At the quarterly meeting of the board Mr. Tulley announced that the deficit in the company's income during the year to Nov. 1 was \$853,962. He estimated the total deficit of the year to Dec. 31, 1923, at \$1,000,000. He said that through economics in operation,

Yellow Cab

Drivers Measured By Their Deeds

How do you measure a man, by his reputation or his deeds? Hardly by reputation, for that is often false. By his deeds then? Of course. *That's the way we measure our drivers, and they either rise or fall by what they do.*

We pick these men by what their neighbors and tradesmen say of them, by their standing and reputation for ten years back. But it isn't their reputation that holds them here. We judge them by their deeds and how they serve you.

Their deeds have held most of them here for a long time. And they must be mighty good men or they couldn't stay here year after year. Don't you find them reliable men, and don't you find that in the main they are worthy of your friendship?

Naturally one will slip occasionally, "even as you and I." He will do something, or leave something undone, which annoys or angers you. And then you are apt to roast "the other ninety and nine." That is hardly fair, because as a body they are the best and fairest workmen we ever knew.

Just take notice of them when next you are on the street. See how busy they are and how seldom you see one loafing. They are alert, intent on their business, earning a living and anxious to please.

Be nice to them if they are nice to you. They are part of your daily life. Give them a smile once in a while. A smile is a big thing.

The thinking fellow calls a Yellow

Yellow Cab Co.

'Phone Calumet 6000

Why Not Some Advertising of This Sort, Boosting Electric Railway Trainmen? It Would React Favorably on the Men as Well as on the Car Riders. If They Did Not All Measure Up to the Standard Set in the Ad, Such Advertising Would Inspire Them to Try to Measure Up

impossible under the labor conditions that existed before the strike, the company could return to the 5-cent fare if it were carrying upon its cars all passengers now transported in jitneys, club cars and in privately owned motor cars. The present fare is 7 cents with four tokens for 25 cents.

The president of the co-operative committee submitted a report showing that during the year fifteen members had died and that \$15,000 in insurance had been paid to their families. Sick benefits of \$10,379 had been paid and \$20,000, par value, of the company's gold bonds had been acquired. There is now a cash balance on hand of \$4,515 as the result of the first year's operation of the Mitten co-operative plan.

Oklahoma City-Shawnee Interurban Line Planned

The Corporation Commission of Oklahoma has recommended approval by the Interstate Commerce Commission of a project to refinance and rehabilitate the old Oklahoma City-Shawnee-Atoka line of the Katy railroad, which has been in financial difficulties for several years. The line was disposed of at receiver's sale on Sept. 28, this year, and K. W. Shartel, attorney, of Oklahoma City, and others, are asking authority to issue bonds and stock to refinance the property.

If the Interstate Commerce Commission accepts the recommendation of the Oklahoma commission the line probably will fall into the hands of two companies organized for the purpose of operating it, the Oklahoma City-Shawnee Interurban Railway and the Oklahoma City-Ada-Atoka Railway. The former project contemplates electrification of the line from Oklahoma City to Shawnee and the latter to operate steam-propelled cars from Shawnee to Atoka.

Final ownership of the property depends upon success of efforts to issue \$800,000 of common stock and an equal amount in first mortgage bonds in connection with each project and other financing details. There is a possibility that the proposed electric portion of the line may be acquired by the Shartel interests and run in connection with the interurban system of the Oklahoma Railway, now operating lines from Oklahoma City to Norman, to Guthrie, to El Reno and intermediate points on each line.

Mr. Kempster Returns After Illness.—After an absence of several months, due to illness, A. L. Kempster, general manager of the New Orleans Public Service, Inc., made his first public appearance at a dinner tendered him on Nov. 27 by the Commercial Club's members of the corporation. Mr. Kempster gave a short talk to the assembled corps of workers of the utility on its purpose and obligations to the public and the best methods to be employed to advance their joint interests.

City Operates Bridge Service

Brooklyn Surface Lines Withdraw from Williamsburg Bridge When City Takes Over Shuttle Line

Shuttle service over the Williamsburgh Bridge between Marcy Avenue, Brooklyn, and Essex Street, Manhattan, was started on Dec. 1 by the city of New York with rolling stock equipment of its own. Operation is under the direction of the Department of Plants and Structures, with Grover A. Whalen, head of the department in charge. The run from terminus to terminus of the bridge is a little more than a mile. Tickets are sold at the rate of three for 5 cents. The equipment on hand consists of fifty-four cars, composed of thirty-two Birneys bought especially for the bridge service and twenty-two rebuilt cars secured previously from the Second Avenue Railroad for use on the city's line on Staten Island.

On the morning that this service was begun the Nassau Electric Railroad, the Brooklyn, Queens County & Suburban Railway, the Coney Island & Brooklyn Railroad and the Brooklyn City Railroad, all operating surface lines in Brooklyn, withdrew from the operation of cars across the bridge from Brooklyn into Manhattan. These lines now all terminate near the Bridge Plaza, Brooklyn, and former patrons of them desiring to travel to Manhattan are required to pay an extra fare on the bridge locals operated by the city or else take the elevated line over the bridge from the plaza, for which they must pay an extra fare of 5 cents. It is, however, possible for a few of them to take cars of the New York City surface lines at the plaza in Brooklyn, for in contradistinction to the service operated from Brooklyn into Manhattan by the Brooklyn lines the New York surface lines, or more properly the Manhattan surface lines, operate from Manhattan into Brooklyn.

The original terminus of the Brooklyn lines which have been using the bridge was at the ferries at the foot of Broadway, Brooklyn, but with the opening of the bridge ten years ago a new approach to Manhattan from Brooklyn was afforded and the Brooklyn lines began to operate into Manhattan over the bridge, but there was not franchise obligation in connection with this operation. In addition, in accordance with a contract with the city now expired, the Brooklyn surface lines operated the purely local shuttle service over the bridge. The contention of the Brooklyn surface companies is that they were able to continue operation of their lines into Manhattan because they have been able partially to pay the added cost which the through service has entailed from the revenues derived from operation of the local service on the bridge. The Brooklyn companies regarded the determination of the city to take over the local bridge service to be not only detrimental to the best interests of

the traveling public but unfair to the companies affected.

The companies said they could not possibly, from a physical standpoint, continue their service in connection with the city service. The shuttle service as handled by the Brooklyn companies was about 40,000 passengers a day. In addition 68,000 passengers a day were handled on the through cars. The fare on the private shuttle line was 2 cents cash with three tickets for 5 cents.

It had been indicated that Mr. Whalen would ask the Transit Commission to take action to compel the Brooklyn surface lines to continue to run their cars across the bridge. The Transit Commission says that it has no such power. The commission points out, as the companies had done previously, that the Brooklyn lines have not been operating surface cars upon the bridge under corporate franchises.

Immigration Program at New York Meeting

Administrative leaders in Washington, not only in the House and Senate, but in executive departments as well, will follow the recommendations laid down in the message of President Coolidge, and be guided by the nation at large on the question of needed immigration laws. Advices to this effect have been received from official sources by the sponsors of the National Immigration Conference, which will be in session at the Hotel Astor in New York, on Dec. 13 and 14.

The immigration conference in New York will be the first of its kind ever held. It will be attended by representatives of business organizations, official departments of the government, public and social service organizations, delegates of several foreign governments, and individuals who have made a study of the whole effect of immigration on the national life. The conference has been arranged by the National Industrial Conference Board, which found at the end of a two-year study of the problem both here and abroad that definite information on which to base new laws was desired by legislators and industrial leaders of the country. The present per centum act expires next June and its retention or new laws form one of the major questions now before Congress.

Wages in Philadelphia to Be Increased

The Philadelphia Rapid Transit Company is to raise its basic wage from 64 cents to 65 cents an hour on Jan. 1. Any further increase in 1924 will be paid to the trustees of the co-operative wage dividend fund. Average of the three cities used as a basis for Philadelphia Rapid Transit wages is 67½ cents an hour, Chicago being 73 cents, Detroit 70, and Cleveland 60, so on the present scale there would be 2½ cents an hour to be paid to Philadelphia Rapid Transit wage fund trustees.

Indeterminate Franchise Suggested for Los Angeles

The Board of Freeholders elected at the last general election in Los Angeles for the purpose of framing a new city charter has approved a charter provision for the indeterminate type of franchise.

The proposed charter amendment as adopted is subject to exhaustive conditions and will allow the widest latitude possible in the selection of the type of franchise desired, whether for a fixed or indeterminate period of time. The proposed amendment to be incorporated in the new city charter gives the City Council of Los Angeles the power to grant either a fixed or indeterminate franchise.

Such a condition will allow public utilities or the city to carry out a program of expansion and alleviate troubles of that character that have been difficult to solve in the past.

A protection of the city's ultimate development of a subway or elevated railway system is contained in the amendments to the charter by a provision that gives the city power to revoke any franchise in or upon any of the streets within the part of the city bounded by Temple Street, Figueroa Street, Washington Street or Central Avenue on a year's written notice.

One Freeholder attempted to draw up a provision relating to transportation utilities, with a view of incorporating a clause for an eight-hour day for platform workers, but the amendment failed to carry that provision.

Ford Road May Be Electrified by Spring

Work on the electrification of the Detroit, Toledo & Ironton Railroad, the Ford road, is well under way. Completion of the work depends, however, upon the development of the Ford power house at River Rouge, Mich. Work on the first of eight 62,500 hp. units of the power house is 85 per cent completed. A test run of the first unit of this plant is scheduled for next January. The second unit is about 15 per cent completed.

The output of the plant will be used entirely for Ford industries, including the Detroit, Toledo & Ironton Railroad.

Work on the turbines was started more than a year ago at the Ford shops following the installation of two units of 12,500 kw. each, made by an outside firm. The production of the new turbines was undertaken by engineers and machinists who helped develop Ford automobile production methods and handled the manufacture of turbines for the Ford "Eagle" boats.

In connection with the electrification of the Detroit, Toledo & Ironton Railroad, the double track from River Rouge to Flat Rock is more than half completed. This is the first section on which electricity will replace steam. All of the activities toward electrification of the first section are scheduled for completion next May.

Payment of Franchise Tax in Cincinnati in Prospect

Settlement of Cincinnati's traction problem is foreseen in the action taken at a recent meeting of the Hamilton County executive and advisory committee. One outstanding feature of the meeting was the adoption of a resolution which indicated that the organization would work to bring about the immediate payment of the \$350,000 franchise tax due yearly from the Cincinnati Traction Company and induce better service and lower rates of fare. Committees representing the traction company and the Cincinnati Street Railway, which leases the railway system, have been negotiating for the past two years in an effort to bring about a settlement of the matter, but little progress has been made in the direction of a settlement. Therefore the city administration appears to be determined to force one of the companies to act.

Some members of the Republican organization are of the opinion that the only definite step is to refuse any further deferment of the franchise tax. Others feel that a forfeiture of the traction company's franchise is the surest move, while still another group contends that a consolidation of the Cincinnati Traction Company and the Cincinnati Street Railway and a divorce of the traction company from its subsidiary companies would solve the problem. It was announced that Mayor George P. Carrel would upon his return to the city call a meeting of the Citizens' Traction Committee, appointed by him more than a year ago, to ascertain what that body has accomplished. It was stated that the Citizens' Traction Committee has been awaiting a decision from the committees representing the traction company and the street railway before making any recommendations. The traction committees have not been in session for more than three months, but since that time the Cincinnati Street Railway has made an offer to the Cincinnati Traction Company to take back the system for \$1,000,000, which the latter company turned down.

Home Rule Legislation Chief Problem Before Legislature

So great and so complicated are the problems presented by the new home rule for cities amendment to the New York State Constitution, adopted by the people at the general election in November, that virtually no other legislation will be considered, or even drafted, until a tentative program for putting the home rule provisions into effect has been promulgated.

This applies particularly to public utility legislation, as until the exact scope of changes in the present law and the additional legislative powers that will be given cities under the provisions of enabling acts to carry the constitutional amendment into effect have been definitely determined any change in the statutes affecting public

utility regulation in so far as their regulation by municipalities is concerned would be entirely without standing.

The first problem the Legislature of 1924 will have for solution will be the granting of specific powers to cities under the home rule amendment. In the interval a conference of mayors of the different cities is to be had to obtain the views of various executives as to just what powers are wanted. So that whatever public utility legislation is considered as a part of the legislative program of 1924 will be coordinated with and subject to the program which is ultimately adopted with reference to the application of home rule.

Hollywood Chamber of Commerce Makes Another Attempt to Compel Extensions

The Hollywood Chamber of Commerce recently renewed its fight to compel the Los Angeles Railway to extend several of its lines, totaling 10½ miles of single-track construction, into the Hollywood district by the filing of a petition for a rehearing of its entire case with the State Supreme Court. The petition sets forth that the tribunal, in its previous decision against the car line extensions into Hollywood, was not in full possession of the facts.

The original petition for a writ of mandate was denied by the State Supreme Court in a decision handed down on Oct. 31, the decision being based on the ground that the Railroad Commission of the State of California had no power to order or compel the railway company to extend its lines when no franchise to construct the line had been applied for, or granted. This matter was reviewed in the *ELECTRIC RAILWAY JOURNAL*, issue of Nov. 10, page 832.

At the time that the court handed down its decision in denying the Railroad Commission jurisdiction in such matters, the court drew a distinction between a railway franchise and franchises under which other public utilities, such as water, gas, electric and power companies, operated. The railway franchise, the court sets forth, specifically limits the amount of territory to be served whereas the franchises of other public utilities do not contain such a provision. The extensions of carlines demanded, the court ruled, could only be obtained under a new franchise.

The Chamber of Commerce in its petition for a rehearing claims that the charter of the railway contains a clause providing for extensions into new territory, although it is admitted that the ordinary railway franchise does not do this. This declaration, it is cited, is as binding as a franchise when a district to be served offers remunerative traffic.

The territory specified is already served by the Pacific Electric Railway lines. The cost of the extensions is estimated at \$1,500,000.

One-Man Car Agitation Dropped

The referendum petition for the abolition of the one-man cars in Massachusetts, which was to be filed Dec. 5, was not filed. Not enough people were interested to carry out the threatened referendum. Presumably, this closes the agitation in Massachusetts, at least for the present.

News Notes

Adjustment May Effect Electrification Project.—Litigation that has prevented work on the electrification of the Missouri, Kansas & Texas Railroad between Dallas and Denton may be ended through the efforts of the citizens of Dallas to bring about an adjustment of the opposition of residents on one street in the city of Dallas toward the construction of the interurban railway track. Arrangements for carrying out the work of electrification have been completed.

Elevated Use Unsettled.—The question of the continued use of the elevated railway at Kansas City has not been settled. Judge Store of the Federal court said recently that both Kansas City, Kan., and Kansas City, Mo., would have to do away with the rentals which have been charged to the Kansas City Railways, but neither city would agree to do this. Consequently, the matter is still open and appears likely to remain open until after the question of lifting the receivership of the railways has been settled.

Grants Wage Increase.—The United Railways & Electric Company, Baltimore, has granted a wage increase to its employees amounting to about 2 per cent. The change takes effect Jan. 1. The largest class of employees, motormen and conductors, will receive from 46 to 51 cents an hour instead of from 45 to 50 cents.

Mr. Craig's Sentence Remitted.—President Coolidge on Dec. 5 remitted the sixty-day jail sentence imposed upon Charles L. Craig, Controller of New York City, by Federal Judge Julius M. Mayer of the United States Court for the Southern District of New York, for criminal contempt of court. This action was recommended by Attorney General Daugherty after consideration of the case by the legal staff of the Department of Justice. The Attorney General and his advisers opposed the granting of an outright pardon and severely criticised Mr. Craig, and the President approved the department's recommendations for only a remission of the sentence. Sentence was passed upon Mr. Craig by Judge Mayer because the court was convinced that Mr. Craig had cast aspersions upon the court that were in no way justified by the facts. Mr. Craig's remarks were made in connection with the court's handling of the affairs of the Brooklyn Rapid Transit Company, then in receivership.

Ordinance Provides for Terminal Change.—Commissioner Paul H. Maloney of the department of public utilities of the New Orleans Commission Council has offered an ordinance for adoption which provides for the removal of the terminus of the Orleans-Kenner Electric Railway from its present site to South Liberty Street. The purpose sought by the Maloney ordinance is to relieve the existing traffic conditions in South Rampart Street, near Canal, which the report by John A. Beeler referred to as a menace to public safety. The ordinance represents the conclusions reached by the city officials and those of Jefferson Parish after a long series of conferences. The Orleans-Kenner line is not released, under the ordinance, from carrying out its obligations, under its franchise, to build a permanent terminal in New Orleans.

Men from Offices Act as Trainmen.—When twenty-four out of twenty-five operators of cars on the Holland division of the Michigan Railway failed to report for work on Dec. 1, officials of the company left their desks and became motormen for a day. F. W.

Brown, general superintendent of the company, said the trouble had started when the men objected to the combination of freight and passenger business in one run. He announced that the men had violated their agreement with the company which provides that in case a matter at issue is not settled between the superintendent and the men it shall be referred to the general manager, and then, if still unsettled, shall go to the arbitration board. The twenty-four operators were not permitted to resume their work.

Reaches Agreement on Service.—The Public Service Commission on Nov. 16 closed its records on the complaint of the Woodlawn (Erie County) Taxpayers Association against George Bullock of the Buffalo & Lake Erie Traction Company, in relation to car service between Woodlawn Beach and Buffalo. This action was taken by the commission on an agreement of the receivers of the Buffalo & Lackawanna Traction Company and the Hamburg Railroad to operate their respective cars so as to meet at least once an hour for an interchange of passengers at the Hamburg turnpike at the Buffalo city line.

6d. for 1d. stages to 4s. for stages costing 3.5d. to 4d. total. The Colne pass will cost 2s. The weekly pass is arousing great interest among other British tramways, which hope thereby to be able to retain the usual 1.5d. minimum fare for all but regular riders instead of being compelled to go back to the pre-war fare of 1d. for single trips. In some cases, therefore, the pass prices are being considered on the basis of giving a reduction to regular riders at little or no loss compared to what would follow a cut to the lower base fare for everybody.

Esthonia Plans Improvements

The Esthonian government plans spending 30,000,000 Esthonian marks for railway improvement and 25,000,000 marks for the construction of railway building. In addition 34,000,000 marks will be used for the electrification of the Reval-Nemme line.

Zurich Street Railways Extend

The report of the Zurich Municipal Street Railways (serving 199,567 inhabitants) for the calendar year 1922 is notable for announcement of extensions. In March, 1922, construction was begun of an extension costing 680,000 francs (approximately \$136,000). In September a credit of 198,000 francs (\$39,600) was granted for a second extension. The number of single-track miles in operation increased from 49.3 miles to 50.9 miles, exclusive of some 4.8 miles of carhouse and yard trackage.

The number of passengers declined slightly over 1921, viz., from 46,660,218 to 46,273,856, and revenue dropped from 11,716,327 francs to 11,577,076 francs. The average fare was 25 rappen or practically 5 cents. The average number of rides per inhabitant per annum was 232 compared with 230 in 1921. The city service amounted to 11,400,343 car-km. (say 7,068,000 car-miles), of which 3,018,653 car-km., or 1,872,000 car-miles, was furnished by trailers. The annual service per inhabitant was 57 car-km., or 35.3 car-miles. This was achieved with 241 motor cars and eighty-seven trailers.

There was no change in fares. Some 24 per cent of the riders used the 20 rappen or minimum single fare, another 15 per cent paid 30 rappen and about 8 per cent paid 40 rappen. Most of the remaining fares were paid in the form of weekly limited-ride tickets, workmen's tickets and unlimited-ride, non-transferable season tickets or passes. Total gross for the year was 11,774,808 francs, while operating expenses increased 0.46 per cent to 9,740,249 francs, leaving 2,034,558 francs for overhead charges, renewal funds and the like. Beginning with the year 1920, it has been possible to meet all of these costs and also to reduce to 1,589,296 francs (end of 1922) the deficit of 2,842,256 francs which had accumulated over the period 1914-1919 because of war conditions.

Foreign News

Interchangeable Season Tickets in London

A new form of interchangeable season ticket, good on railway, tramway and bus, has been used by the London Underground Railway and associated companies as an experiment since last May. It has proved so successful that the scheme is being further extended. The ticket, which is a season one, has been tried up until recently at Golder's Green Station. It enables a passenger living beyond that place to board a bus or a tramcar, travel to Golder's Green Underground Railway station and continue his journey by the railway. Over 1,000 tickets of this kind are now in daily use at this point. The scheme has been extended to a number of other suburban stations on the Underground Railway, and still further extensions are contemplated.

British Fare Agitation as Seen by "Journal" Representative

There is some agitation in nearly every city in the United Kingdom for a return to the pre-war rates of fare on electric railways, according to a representative of the ELECTRIC RAILWAY JOURNAL, who recently has returned to this country from a trip abroad. At least, there is periodic clamor for reductions in the rates being charged. The argument against a reduction in the rate of fare beyond the point that is justified, which seems to impress the public, is that the taxpayers in a community are discriminated against unjustly when street car

fares are reduced to the point that does not allow an adequate return on the investment. Street cars are used by taxpayers and non-taxpayers alike. They are used extensively by people from other communities, and by visitors generally. If the fare is too low it means that the visitors and the non-taxpayers benefit at the expense of the community. If the fares do not provide for the return on capital and the maintenance and extension of lines, the necessary funds must come, directly or indirectly, from the city treasury. It is easy to demonstrate how an unremunerative rate of fare on a street railway would discriminate against the community and differs in that respect from electric, gas or water service which is installed in tax-paying property. If the charge for the service does not pay its cost, it is paid indirectly by those who use it. The public in Great Britain seems only recently to have grasped this phase of the fare situation and it has done much to temper the demands for unjustifiable reductions.

Weekly Passes on Four British Tramways

The experiences of Bradford and Doncaster, with a population of 300,000 and 54,000 respectively, with the weekly pass have induced the Rotherham and Colne Corporation Tramways to try the same plan. The population of Rotherham and Colne is 75,000 and 26,000 respectively. The Rotherham Tramways installed a series of passes on Nov. 12 at rates ranging from 1s.

Financial and Corporate

Operation Unified

**Railway Near Philadelphia Co-ordinates
Its Lines and Buses—Population
Served Greatly Increased**

Events are taking place rapidly in the affairs of the West Chester Street Railway, West Chester, Pa. In the last six months the company has acquired many miles of track and more than 100 miles of bus routes. This has resulted in an increase in population contact from 42,000 to more than 300,000.

The West Chester Street Railway formerly operated a line of 21 miles of single track extending from West Grove through Avondale and Toughkenamon to Kennett Square, a distance of 7½ miles, extending thence southward a distance of 14 miles to Brandywine Springs on the outskirts of Wilmington. Almost the entire population served by the railway was located on the Kennett-West Grove division, the earnings of which are understood practically to have carried the whole property.

During the early part of the current year the interest controlling the old property decided to cease operation, and service was stopped during April, 1923. The property was purchased by a bondholders' committee under foreclosure proceedings, and sold by it to local interests. An attempt was made by the purchasers to refinance operation of the whole property, but this attempt was finally abandoned and the 7½-mile section between Kennett and West Grove was sold to the same interests which control the West Chester Street

State Laws, to reorganize the West Chester, Kennett & Wilmington Electric Railway, this being done under the name of the Chester County Traction Company, which will be a subsidiary of the West Chester Street Railway. In this manner the population per mile of track operated on its Kennett division will be increased. The section of railway between Kennett and Brandywine Springs was sold to the S. Snyder Corporation, Rochester, N. Y.

The West Chester Street Railway has through its subsidiary, the People's Transportation Corporation, acquired control of all the motor bus routes in southern Chester County, connecting points in this district with the cities of Chester, Pa., and Wilmington, Del., and a co-ordinated plan of railway and motor bus transportation for the entire district is now being worked out.

\$1,325,896 Balance Reported at New Orleans Under New Agreement

The New Orleans Public Service, Inc., has reported for the year ended Sept. 30, 1923. This is the first year of operation under the new agreement at New Orleans. The balance indicated as available for sinking fund requirements, dividends and surplus return was \$1,325,896. The rate base was fixed to begin at \$44,700,000. The rate of fare dating from Sept. 27, a year ago, was 7 cents. The statement of earnings follows:

INCOME STATEMENT OF NEW ORLEANS PUBLIC SERVICE, INC., BY DEPARTMENTS FOR
TWELVE MONTHS TO SEPT. 30, 1923

	Railway	Electric	Gas	All Departments
Operating revenue.....	\$7,571,560	\$3,914,109	\$2,743,750	\$14,229,420
Operating expenses, including renewals and replacements reserve.....	5,331,175	2,229,132	1,686,908	9,247,215
Net operating revenue.....	2,240,385	1,684,977	1,056,842	4,982,205
Taxes and uncollectible consumers' accounts....	*862,258	451,930	321,293	1,635,482

Railway, operating a railway from Coatesville through Downingtown and West Chester to Kennett Square. The West Grove division will be connected with the Kennett division of the West Chester Street Railway and through service operated from West Grove to West Chester.

In order to effect revival of service between Kennett and West Grove it was necessary, under the Pennsylvania

Commissioner Maloney of the Department of Public Utilities announced on Nov. 25 that he expected to complete soon the negotiations between the city and the Public Service, Inc., over the rate base on which the company is to be permitted to fix its rates for the ensuing year under its agreement with the city. As indicated in the accompanying statement the company in its annual report under the agreement with

the city reported a rate base of \$52,939,371 and a return for the twelve months of 6.61 per cent, which is 0.89 per cent under the return allowed by the franchise.

The city had the books of the company audited, and as a result, Commissioner Maloney says he is opposed to both the rate of return and the rate base shown in the company's report. He thinks the rate of return is larger than shown and the rate base should be lower. The dispute between the city and the company, he says, is over several large items carried by the company as a part of the rate base. It is understood that under the rate base claimed by the city the company will show a return of more than 7 per cent, or less than one-half of 1 per cent under the rate allowed by the franchise.

Some New York Companies Do Better

The New York Transit Commission has made public statements concerning railway operations in New York during the month of September, compiled from monthly reports furnished to the commission by the several companies. The figures for September, 1923, are compared with those for the similar month in 1922.

The Interborough Rapid Transit Company, with gross of \$4,315,178.09; gained, in operating revenue, \$57,095.60 over September, 1922, while operating expenses of \$2,685,495 represented a decrease of \$62,236. The net corporate deficit of the company for the month was \$211,027, less by \$56,981 than in September, 1922. Interborough passengers carried in September, 1923, numbered 79,631,000, which was 1,381,211 over the previous September. The Interborough subway operations ran behind \$21,513 in September, about \$25,000 less than last September's deficit, the big loss occurring on the elevated lines.

The New York Rapid Transit Corporation (B.-M. T.), with gross of \$2,056,426, gained \$151,843 in operating revenue, while at \$1,399,078 its operating expenses decreased \$9,901. The company showed a net corporate income for the month of \$91,727.53, as against a deficit of \$71,207 under the receivership in 1922. Passengers carried numbered 40,078,420, a gain of 3,043,471 for September, 1923, as against September, 1922.

The New York Railways, with gross of \$758,524, showed a decrease in operating revenue of \$60,626. Operating expenses of \$654,674 were \$38,533 less than for the similar month in 1922. The net loss of \$139,662 was \$6,500 more than in September, 1922. With traffic of 13,428,905 the company carried 1,045,776 fewer passengers in September, 1923, than in the similar month in 1922.

The Third Avenue Railway system had a net corporate income of \$20,824, or \$12,495 less than September, 1922. Passenger traffic was 4,893,081, or 173,798 less than in September, 1922.

Mr. Fagan's Figures Attacked

Special Master, Representatives of City and Pittsburgh Railways' Reorganizers Question Receiver's Figures

At the proceedings conducted before the court on Nov. 26 with the end in view of lifting the receivership of the Pittsburgh Railways three elements were on record as declaring the railway solvent. They are former Judge Wasson, special master for the court; the city of Pittsburgh, and the railways company reorganizers, as represented by the Philadelphia Company. As stated previously, Charles A. Fagan, one of the receivers, holds that the company is still insolvent.

Special Master Henry G. Wasson, delegated by the court to inform it whether the reorganization was possible at this time, recommended the reorganization. He figured the working assets of the company at the end on one year's operation by the owners would be \$1,795,075.

Receiver Fagan of the railways acting independently of his two colleagues, Receivers W. D. George and S. L. Tone, informed the court, shortly after the Wasson recommendation was filed, that the railways, instead of being solvent, was still "manifestly insolvent" and he submitted figures to show that instead of a surplus the railways after one year's operation would show a deficit of at least \$1,285,207 or, if other elements were considered, a deficit of \$3,036,668.

The city's figures, with those of the Philadelphia Company, parent company of the Pittsburgh Railways, were filed with the court on Nov. 26, the latter in the name of the Pittsburgh Railways as a corporation, and in the form of an answer to Mr. Fagan's figures.

A surplus at the end of the first year's operation, instead of a deficit of \$1,500,723 is claimed in the reply to the Fagan figures submitted in behalf of the reorganizers by A. W. Robertson, vice-president and chief counsel. Mr. Robertson's petition is in part as follows:

From an examination of the Items in Exhibit A, attached to Mr. Fagan's report as made in detail in our Exhibit 2, it will be seen that items totaling \$1,101,930 are duplicates and are included twice in the figures shown in said Exhibit A, and that the total deductions in said exhibit should be reduced by the amount of such duplication.

A further examination of Exhibit A discloses that it includes \$1,684,000 as payment of retirement of capital, which is not properly chargeable against operating expenses, and which the company has no expectations whatever of paying out of the operating income, but does expect to pay such obligations as they come due in future years by selling other securities or extending the time of payment of the respective obligations themselves.

Taking into account these several items, the aggregate of the sums which must be met during the coming year are reduced to \$4,800,728. This leaves a surplus of \$1,500,723. Instead of a deficit as shown in the original Exhibit A.

Partial Discontinuance Allowed.—The Public Service Commission recently granted permission to the Massachusetts Northeastern Street Railway to

discontinue its railway service on 3 miles of its road between Rowe's Corner, Newton, to the state line at South Hampton. Residents of Newton protested against the discontinuance of this branch.

Abandonment Threatened at Astoria, Ore.

The railway at Astoria, Ore., will probably be abandoned. The system is one of a little more than 5 miles. It is owned by the Pacific Power & Light Company. Just about a year ago, Dec. 8 to be exact, an area of thirty-five city blocks was wiped out by fire and the railway and the power and light lines of the company were damaged to the extent of about \$175,000. Fortunately the main feeders of the company were installed just beyond the limits reached by the fire, so that power and railway service were quickly resumed. More than fourteen blocks of railway track was destroyed. The necessity arises now to rehabilitate the railway system. That work the company's engineers estimate would cost \$150,000. As the railway is a losing proposition the company has notified the local City Commission of its intention of abandoning the railway.

Auction Sales in New York

At the public auction rooms of A. H. Muller & Sons the following securities were sold on Dec. 5:

4,000 shares Interborough Consolidated Corporation, common, 5 cents per share.
505 shares of Second Avenue Railroad, 50 cents per share.

\$5,000 Second Avenue Railroad 6 per cent receiver's certificates, 37½ per cent flat.

\$41,000 Second Avenue Railroad first consolidated 5 per cent bonds, due 1948, certificates of deposit 3 per cent.

1,000 shares of Mobile Light & Railroad Company, \$1 per share.

310 shares of Interborough Consolidated Corporation common, \$3 lot.

300 shares of Interborough Consolidated Corporation common; 550 shares Interborough Consolidated Corporation preferred, \$100 each, \$85 lot.

50 shares of Brooklyn Rapid Transit Company, \$2 lot.

Permission Sought to Abandon Suburban Line in Oklahoma

The Pittsburgh County Railway, which operates city lines in McAlester and North McAlester and an interurban line to Hartshorne, Okla., will be heard on Dec. 20 before the Corporation Commission on a petition seeking permission to abandon its line extending from the eastern limits of McAlester to the country club. During the past two years, the petition recites, the line has been operated at a great loss. In fact the petition states that the whole city system is being operated at a loss and continued operation of the country club line will only increase the financial burden now placed on the entire system. Business began falling off on the country club line as early as 1919, when the company secured an order from the commission permitting it to suspend service from April 1 to Nov. 1 of each year. The company now desires permission to abandon the line entirely and take up the tracks.

Negotiations on to Lift Birmingham Receivership

The receivership of the Birmingham Railway, Light & Power Company, Birmingham, Ala., may be lifted soon after Jan. 1. J. S. Pevear, co-receiver for the company, and W. B. White, attorney representing Lee C. Bradley, the other receiver, have been in New York working toward that end.

It has not been made public in Birmingham how the transaction will be handled, but it has been indicated that local interests may borrow the money in New York, give the property of the company as security, and operate it themselves.

Preferred Stock Offered.—Harrison & Company and Janney & Company, Philadelphia, Pa., are offering \$1,400,000 of the first preferred 8 per cent cumulative stock of the Georgia Railway & Power Company, Atlanta, Ga., series of 1924. The price is 104 and accrued dividends to yield 7.69 per cent.

Mortgage Gold Bonds Offered.—A syndicate, headed by Drexel & Company, Philadelphia, Pa., is offering \$4,000,000 of the first and refunding mortgage 5 per cent gold bonds of the Southern Public Utilities Company, Charlotte, N. C. The bonds, dated July 1, 1913, and due July 1, 1943, are offered at 91½ and interest to yield about 5.75 per cent. This is an additional issue, the proceeds for which will reimburse the company in part for capital expenditures already incurred in excess of \$7,800,000, which includes the cost of the new 80,000 installed hp. Mountain Island hydro-electric station to be put in operation next month.

Board Has Vacancy.—The death of former Governor Samuel W. McCall of Massachusetts creates a vacancy in the board of trustees of the Eastern Massachusetts Street Railway, Boston, Mass. Mr. McCall was one of the five public trustees having been appointed to succeed Homer Loring, former chairman, who resigned. The terms of the trustees, who were appointed for a five-year term, expire in January next. The law requires appointment of successors to serve for another five-year period beginning in January. The four remaining trustees are Arthur G. Wadleigh, chairman; Fred J. Crowley, Isaac Sprague and Earle P. Charlton.

Collateral Securing Notes Sold.—At an auction of \$3,000,000 first lien and refunding mortgage gold bonds of the Washington-Virginia Railway, Washington, D. C., the entire amount was bought by Edward P. Hopkinson, Jr., representing the note holders, for \$2,000. The 6 per cent notes, which matured on Jan. 1, 1922, were secured by these bonds. Before the sale R. H. Phillips representing some of the bondholders, stated he thought bidders should know that receivers had been appointed for the company, and he deemed it improper that the bonds should be sold without an order of the court.

Traffic and Transportation

Commission Recommends Traffic Improvements

The Los Angeles Traffic Commission has recommended to the City Council that certain practices be adopted for bettering traffic conditions. One provision calls for immediate adoption of an ordinance prohibiting the parking of passenger vehicles in the downtown congested district of the city from 7 to 10 a.m. and 4 to 6:15 p.m. instead of only from 4 to 6:15 p.m. as at present, and to be effective only during the holiday season to relieve pre-holiday congestion. Stricter enforcement of present state and city traffic regulations is also suggested.

The commission also recommended that the police department rigidly enforce the existing loading zone ordinance, prohibit the parking of vehicles in the second line of traffic and use its full authority to facilitate the free movement of street cars wherever police officers are available.

It recommends further that the Los Angeles Railway and Pacific Electric Railway be authorized to paint yellow lines on the street surfaces wherever desirable parallel to the outside street tracks 4 ft. from the outside rails. This color is suggested in order that the lines will not be confused with the white lines used in marking the loading zones.

The Traffic Commission offers to aid the Los Angeles City Council in any capacity it may determine to relieve what is termed to be an unusual condition in traffic congestion.

Special Theater Fare Rates Made by Indiana Interurban

It has been announced by the Indianapolis & Cincinnati Traction Company that very low round-trip rates will be made during December for the benefit of patrons attending Indianapolis theaters in the evening. The new reduced fare will be good only on evening trains. It is expected that this plan will develop additional business on trains that are usually operated at a loss. It is understood that if the theater fare arrangement proves popular it may be made a permanent feature of the I. & C. service.

One-Man Car Case Before the Wisconsin Supreme Court

The one-man car situation in Milwaukee is expected to be drawn to a head on Dec. 14. On that day the Wisconsin Supreme Court will hear and consider the appeal of the city attorney of Milwaukee charging that the Wisconsin Railroad Commission exceeded its authority when it granted permission to the Milwaukee Electric Railway & Light Company for the operation of

one-man cars in Milwaukee. The city contends that the State Legislature never conferred on the commission power to approve the operation of one-man cars in Milwaukee.

The city attorney says that operation of one-man cars in Milwaukee is contrary to a city ordinance. The contention of the city attorney that cars must be run with two men was not upheld by the Dane County Circuit Court, Madison. That court ruled that the Railroad Commission did have jurisdiction over the operation of these cars in Wisconsin cities, and it is from this decision that the attorney for Milwaukee is appealing to the Wisconsin Supreme Court.

Plush Seats in New Chicago "L" Cars

Several trains of the new steel cars recently received by the Chicago "L" were placed in service Dec. 2 on the various branches of the Chicago Elevated System. Shipments of these cars from the plant of the Cincinnati Car Company to date total 75 out of the 102 ordered. The cars are similar in construction to the company's 1914 design of steel cars with the exception that the center side door has been eliminated.

The interior has been equipped with

a view particularly toward supplying passenger comfort and attractive appearance. Green plush upholstered cross seats, white maple grooved floor, shaded side and center lights, and oscillating fans at either end are some of the interior features.

Electro-pneumatically operated sliding doors, with automatic interlock switches inclosed in the rubber bumper, have been provided at the ends of the car. Control switches for operating these doors are mounted on the outside of the dash at each end of the car and so arranged that the guard may open the doors at both ends of the cars.

All the new cars will be motor cars with two motors on each car, both located on one truck. The motor truck has a wheelbase 12 in. longer than that of the dead truck.

Following out the plan which originated some months ago, the new cars are painted orange above the belt rail and a brilliant green below the belt rail, with the sash and doors also painted green.

PRINCIPAL DIMENSIONS OF NEW CHICAGO "L" CAR

Length over bumpers.....	48 ft. 0 in.
Width over drip rails.....	8 ft. 10 ³ / ₄ in.
Height, top rail to top roof, light.....	12 ft. 3 ¹ / ₂ in.
Truck centers.....	33 ft. 8 in.
Wheel base of trucks (trailer end).....	5 ft. 6 in.
Wheel base of trucks (motor end).....	6 ft. 6 in.
Wheel diameter.....	34 in.
Seating capacity.....	48
Door width.....	3 ft. 8 in.
Aisle width.....	21 ¹ / ₂ in.
End wall width between longitudinal seats.....	4 ft. 0 ¹ / ₂ in.
Seat width.....	40 in.
Seat spacing.....	2 ft. 8 ¹ / ₂ in.

More Comfort and Attractiveness Are Features of New Chicago "L" Cars

Ten Cents Cash Asked

Atlanta Company Says It Can't Continue Under Present Conditions—Wants Jitneys Curtailed

An increase in single cash fares from 7 to 10 cents is being sought by the Georgia Railway & Power Company, tickets to remain at their present price of 6½ cents each if bought in strips. The company desires to charge 2 cents for transfers. It wants jitneys eliminated from street way now operates and desires to do away with unnecessary car stops. These are some of the things requested in a petition filed by the company with the Atlanta City Council, on Dec. 1. The petition states:

If present conditions continue, there will shortly be no margin of profit left to the company after operating expenses have been paid, and the ability of the railway to maintain the present transportation service will be ended—a condition which has never before existed in Atlanta, but which can be prevented by the plan submitted in this petition.

Already the credit of the railway is exhausted and not one dollar of additional capital can be borrowed either for the purpose of improving existing mileage or for making extensions.

The railway business can be put on a living basis by increasing the number of passengers carried, by lessening the cost of operation, or by increasing the fare per passenger.

As we cannot increase the number of passengers carried or decrease the cost of operation, the only thing left to do is to increase the fares.

Jitney competition is unfair. If continued it will subject the railway to such losses that it will be forced to discontinue operation. Jitneys should not be licensed except where the necessity for them is shown.

Ten cents cash fare is asked because the cost of furnishing railway service has more than doubled since 1914. Car riders will pay no increase in fare if they buy tickets.

A 2-cent charge for transfers is asked because the cost of furnishing service has more than doubled.

No service should be furnished free. Free service can only be given at the expense of those who pay the fares.

The management should be vested with reasonable authority in eliminating unnecessary car stops. The car stops in Atlanta are unnecessarily frequent and prevent quick, reliable service as well as increase the cost of the service.

The petition also asks the removal of all the indirect and special taxes assessed against the railway and its property, declaring that these taxes must ultimately be levied against the passengers, since the only money received by the company with which to pay taxes comes from the fares received by its passengers.

It asks that railway property in Atlanta be taxed only on an equal basis with other classes of property in the city.

The petition closes with the statement that the company is interested only in making a reasonable profit on its investment, and in rendering the best service possible to the people of Atlanta.

Indiana Interurbans to Use Buses

Extensive operation of buses is being planned by electric railways in Indiana to meet competition from lines independent of the railways. The Interstate Public Service Company and the Indianapolis & Cincinnati Traction Company are operating buses now as

feeders and the present bus systems will be extended. As noted elsewhere in this issue the I. & C. has closed a contract for bus service to connect Versailles, Osgood and Greensburg, to be operated in conjunction with the traction lines. Several bus lines now carry passengers from small towns and farms to the cities and stations of the Interstate Public Service.

Buses May Have to Be Withdrawn in Louisville

James P. Barnes, president of the Kentucky Carriers, Inc., Louisville, Ky., subsidiary of the Louisville Railway, stated on Nov. 30 that the present city bus service would probably be abandoned unless the public supports the local lines better. At the present time the bus service is not earning more than 60 per cent of operating costs, and very little improvement has been shown in earnings since the recent change in the operating schedules. The fact that the idea of service by bus is new and that the public has not become accustomed to the service are regarded as partly responsible for lack of patronage.

Flood at Oklahoma City Causes Influx of Jitneys

Jitney competition menaces the Oklahoma Railway. Following the destruction by flood of the bridge and a half mile of fill on the right-of-way between Oklahoma City proper and the section of the city known as Capitol Hill, city and Norman interurban cars had to be rerouted via Packingtown. This involved serious delay to traffic and automobiles began carrying passengers between Capitol Hill and the city for 10 cents. The railway facilities were restored with the opening of the new bridge over the North Canadian on Dec. 3, but the city attorney announces that there is no legal barrier on the ordinance books of the city preventing the operation of jitneys.

Will Establish Safety Zones.—The Trenton-Mercer County Traction Corporation, Trenton, N. J., will establish safety zones and mark trolley stops with lights along part of Pennington Road.

Enforcement of Ordinance Against One-Man Cars Postponed.—A measure approved by the electorate of Dayton, Ohio, early this fall, placed in immediate effectiveness theoretically, a ban on the one-man car. Jan. 1 is the date tentatively set by the city for enforcing the measure, but in the event the companies cannot make the physical changes in their property by this time, it has been indicated that the date will be extended. Indications are said to point to an arrangement being made which will permit the cars to remain in service under conditions of street traffic more favorable than those that now exist.

Higher Rates Sought.—The United Electric Railways, Providence, R. I., has

applied to the Rhode Island Public Utilities Commission for permission to raise its fares so as to give nine rides for 50 cents. The rate at present is ten rides for 50 cents. Single fares are to remain at 6 cents. The reason given by the company in its request for increased rates was that receipts were running behind operating expenses.

"Transportation" Appears.—The National Transportation Institute is publishing, each Tuesday, a new pamphlet, entitled "Transportation." In its relation to all industries, the subject of transportation is covered in detail in this sheet. Number 4 of Vol. 1 tells what the National Transportation Institute really is. It explains in an editorial that the institute represents the business men's solution of the transportation problems of the United States. Further, that its purpose is to aid the public in understanding the business problems of transportation, in order that growth of agriculture and industry may continue. The paper is dated Chicago.

Bus Operation Started.—Operation of its first auxiliary motor bus line was started Nov. 6 by the Springfield Railway, Springfield, Ohio, the bus operating in Melrose addition and connecting with the Yellow Springs Street cars. Service will be extended by the company if found desirable after the tentative schedule has been given a trial.

Provisions Made for First Class Mail.—First class mail out of Salt Lake City will be carried into Provo by the Orem Electric Railroad within a short time. Arrangements are now being made looking toward converting the interurban into a mail carrier road.

Saving Time in Evening Rush.—The Grand Rapids Railway, in order to speed up accommodations during the evening rush, has ruled that no fares shall be collected from patrons on entering out-bound one-man cars. It is said much time is saved and traffic does not pile up in the downtown section if patrons are hurried directly into the cars during the rush hour. Fares are paid as patrons leave.

First Cattle Cars Moved.—The first electric-way shipment of livestock from Louisville to Indiana markets by means of the new tracks of the Interstate Public Service Company, entering directly into the Bourbon Stock Yards in East Louisville, was consigned on Nov. 12. On that date an electric locomotive pulled out of the yards with three cars of cattle for Indianapolis and three destined for Frankfort, Ind. The six cars contained an average of thirty head of cattle each. The rates, it is said, will be about on a par with railroad transportation charges, but delivery is speedier due to direct movement and elimination of loss of time by switching.

Railway Explains.—The Louisville Railway is running a series of advertisements in the Louisville newspapers in an effort to explain to the public just why the company is not always able to serve its patrons as it would like to serve them.

Legal Notes

Certificate Refused.—Because adequate freight service is being given over the route from Oklahoma City to El Reno and Geary, the Oklahoma Corporation Commission refused to grant a certificate of convenience and necessity to the Highway Transfer Company to operate motor car freight lines. One of the objectors to the granting of this certificate was the Oklahoma Railway. That company contended its own lines had established stops about every half mile where freight was received and discharged. The order became effective Nov. 21, 1923.

Bus Contract Helps Service.—Inter-urban facilities of the Indianapolis & Cincinnati Traction Company have been extended by the closing of a contract for bus service in Versailles, Osgood and Greensburg. An announcement of this service was made by Hudson R. Biery, assistant to President Henry.

Company Shows Its Progress.—The Galveston Electric Company, in an advertisement in the annual trade edition of the *Galveston Daily News*, presented "The Old and the New" in railway operation in Galveston. Two pictures were reproduced. One showed the old-time mule car, while the other showed one of the new one-man safety cars recently put in use in Galveston. The aims and ideals of the traction company are then set forth briefly by R. G. Carroll, local manager at Galveston.

Increased Fares Sought.—The Hannibal Railway & Electric Company, Hannibal, Mo., has filed an application for increased fares with the Missouri Public Service Commission. A hearing on the petition will be held in Jefferson City, Mo., on Dec. 11. The company estimates the increase would net it approximately \$1,800 a year. Increased cost of labor and materials is given as the reason for the application.

Traffic Model Will Tell Story.—The Springfield, Mass., Police Department has introduced an adjustable traffic model which is recommended by the American Automobile Association for adoption by courts throughout the country in trying cases arising from street accidents. An improved form of this model was used at an inquest in Springfield recently for the first time. It is provided with miniature street cars, tracks, poles, wires, hydrants, trees, automobiles, vehicles and pedestrians, which can be so placed as to illustrate any kind of street accident. The model is 3 ft. long by 20 in. wide and rests on a wooden base. It has movable sidewalks and intersecting streets. To show an accident on a street without street car lines a metal covering is made to fit over the tracks. Policemen are instructed in the case of every accident to secure the measurements in order to show correctly to the judge and jury the relative positions of the various parties and factors concerned. It has been found that the use of the model saves time and expense in trying cases, particularly as its use does away with the need for special drawings.

ALABAMA—*Waiting Passengers Include Others Than Those Who Signal the Car to Stop.*

Where an interurban car stops to receive passengers the invitation to board the car is not limited to those who signaled for the car to stop. Hence, a person attempting to board the car at such a point and having his hand injured when the door was being closed has cause for action. [Mobile Light & R. Co. vs. Ellis, 96 Southern Rep., 773.]

INDIANA—*Jury Qualified to Pass on Adequate Bonding.*

Where plaintiff's horse ran away while crossing a railroad, claimed due to an electric shock, an instruction that the jury, in determining whether the bonding of defendant's rails was defective and whether there was a leakage of electrical current, should consider whether the earth near the crossing was charged with electricity and whether the electric current would leak from the rails if the bonding was in good condition, and whether other horses suffered an electric shock at the crossing under similar circumstances, and whether electric sparks or flashes were seen at the joints of the rails at the crossing, and, if so, whether that indicated defective bonding, in so far as those matters were shown in evidence together with all the other evidence upon the question held not reversible error under the evidence. [Indianapolis & Cincinnati Traction Co. vs. Montfort, 139 Northeast Rep., 677.]

KENTUCKY—*Third-class City Cannot Grant Franchise Without Requiring Company to Pave Between Tracks.*

The limitation of Ky. St. Sec. 3290, upon the power of third-class cities in granting street railway franchises which prohibits such franchise without requiring the company to pave between the tracks, is mandatory. Hence a franchise granted without such requirement, either expressed or implied, would be void. The provisions of Sec. 3450, relating to the assessment of such cost where the payment is required by the franchise, applies whether the requirement is expressed or implied. [City of Henderson vs. Henderson Traction Co., 254 Southwest Rep., 332.]

MISSOURI—*Penal Statute Held Not to Deny Equal Protection or Due Process.*

Rev. St. 1909, Art. 5425, providing that, when any person shall die from injury resulting from negligence in running any car or train, the corporation shall forfeit and pay as a penalty the sum of not less than \$2,000 and not exceeding \$10,000, construed as wholly penal and as authorizing recovery of

maximum amount, though there is no pecuniary loss, does not deprive railway company of equal protection of the laws, or due process of law, in violation of Const. U. S. Amend. 14. [Grier vs. Kansas City, C. C. & St. J. Ry. Co., 254 Southwest. Rep., 359.]

NEW YORK—*That Car in Collision Was of the One-man Type Held Properly Commented On.*

In an action against the railway company for damages, it was proper for plaintiff's counsel to call the attention of the jury to the fact that the car concerned in the collision was of the one-man type and to point out the duties of the operator in a car of the type used, although there was no contention that the failure to have a conductor on the car was a proximate cause of the accident. [Christman vs. Union Railway, 200 New York Sup., 800.]

OHIO—*Commission Authorized to Deny Application for Issuance of Securities Based on Overvaluation.*

Under Gen. Code, Secs. 614-53 to 614-55, authorizing the Public Utilities Commission to supervise the issue of securities by utilities and railroads, such commission is authorized to deny an application for the issuance of securities based upon an overvaluation, or upon which a fair return may not be probably realized or reasonably expected. [Lima Toledo R. Co. vs. Public Utilities Commission, 140 Northeast. Rep., 603.]

PENNSYLVANIA—*Obligation to Maintain Paving Not Removed by Offer to Surrender Right-of-Way on Street.*

A street railway company is not relieved of obligation, assumed as condition of right to occupy a street, to repair the street because of its receipts being reduced by a subsequent grant by the borough to another company to occupy a parallel street and by another company with which it had had connection passing into the hands of another at foreclosure sale. It is also not relieved of its obligation by an offer to surrender its right on the street and remove the tracks, though it cannot be compelled to continue indefinitely operations at a loss. If it desires to surrender all its powers and franchises and cease its corporate existence, it may make application under P. L. 293; Pa. St. 1920, sec. 5791. If it merely desires to abandon part of its line, thereby affecting service, the determination of the question is for the Public Service Commission, to which is committed the regulation of service. [Borough of Norristown vs. Reading Transit & Lt. Co., 121 Atlantic Rep., 495.]

New Publications

Workmen's Compensation Legislation of United States and Canada—1920-1922

Bulletin No. 332 of the United States Bureau of Labor Statistics, Workmen's Insurance and Compensation Series. Government Printing Office, Washington, 1923.

This bulletin gives a summary of legislation in force on the subject of compensation, which has been enacted in the years covered, followed by an appendix giving the exact text of all laws passed, or of amendments to previously existing laws. It is issued strictly as a supplement to an earlier bulletin, No. 272, which covered the legislation in force at the end of the calendar year 1919.

Ball Test Applied to Cement Mortar and Concrete

By R. E. Crepps and R. E. Mills. Bulletin No. 12 of the Engineering Experiment Station at Purdue University. Published by Purdue University, Lafayette, Ind.

This bulletin describes a method of testing concrete, particularly for highway construction, by means of a steel ball in a manner similar to the Brinell method of testing, which has been generally accepted as a reliable index of the mechanical properties of steel. According to the authors, the ball test affords a valuable and convenient means of determining the compressive strength, provides a reliable index of strength for any age or mix, allows material in place to be tested and provides a new means of studying questions in connection with concrete pavements. Such questions include the effect of wheel loads upon surface strength, the effects of different types of tires upon surface strength, the effect of tire inflation upon surface strength, the distribution of damage on any area of contact, the effect of impact and the recovery of surface strength. Methods of making the test and the procedure involved are described.

Workmen's Compensation Acts in the United States—The Medical Aspect

Research Report No. 61 of the National Industrial Conference Board, New York City. 282 pages.

This volume is a discussion of the medical side of workmen's compensation. The importance of the questions on this subject has been emphasized largely by the inclusion of diseases of occupations in later revisions of compensation laws, and also by the granting of compensation for diseases having only a casual and sometimes remote connection with the occupation or with the original injury. The needed medical experience is now available in the records of decisions of industrial boards and commissions and of the courts. These decisions have been carefully studied by the National Industrial Conference Board and the principles and practices developed have been analyzed in this report. Various types of injury and diseases resulting from accidents are treated in detail. In connection with the study, reference is made to some 800 reported cases.

Personal Items

Samuel Rea Elected President of Long Island Railroad

The board of directors of the Long Island Railroad elected on Dec. 5 Samuel Rea as president of the company, to succeed Ralph Peters, deceased. This is in accordance with the policy that has been pursued on the Pennsylvania Railroad System for several years, that the president of the Pennsylvania Railroad Company shall also act as president of the principal companies in the system.

George LeBoutillier continues as the vice-president of the company, resident in New York, in special charge of the operations of the road and all questions relating to its improvement and service, and of the various departments dealing with all features of the company's operations, except finance and accounting. These latter features are under the supervision of the vice-presidents at Philadelphia, as was the case during Mr. Peters' administration.

C. J. Quill has been appointed to the position of transportation salesman of the Tacoma Railway & Power Company, Tacoma, Wash.

Walter A. Shaw has been appointed by Mayor Dever as the city representative on the Board of Supervising Engineers, Chicago Traction, and his appointment approved by the City Council. Mr. Shaw was formerly engineer of the Illinois Public Utilities Commission, later acting in the capacity of consulting engineer for the city of Chicago and more recently as advisory engineer to the Lincoln Park Board.

Samuel T. MacQuarrie has been appointed director of the New England Bureau of Public Service Information, with headquarters at 24 Milk Street, Boston, Mass. Mr. MacQuarrie has been associated with the banking house of Curtis & Sanger, Boston, and for about twenty years was employed by the Fore River Shipbuilding Corporation at Quincy, Mass., and later by the succeeding Bethlehem Shipbuilding Corporation, Ltd., as assistant to the works manager, and in charge of publicity prior to the Bethlehem acquisition. He succeeds Joseph B. Groce who has joined the staff of the Edison Electric Illuminating Company, Boston.

Frederick Rollins Low, since 1888 editor of *Power*, a McGraw-Hill publication, was inducted as president of the American Society of Mechanical Engineers at the convention held in New York during the week ended Dec. 8. Mr. Low has been active in the affairs of the American Society of Mechanical Engineers since becoming a member in 1886. He served as vice-president of the society in 1918. He will be the delegate of the association to the World Power Conference in London.

Joseph A. Whitlow, formerly connected with the Pine Bluff Company, Pine Bluff, Ark., and superintendent of the Alapco division, has been appointed manager of the Tulsa properties of the Public Service Company of Oklahoma. Mr. Whitlow went to Alapco early in 1919, succeeding the late Minor Q. Woodward with the Pine Bluff Company. His resignation became effective on Dec. 1.

William C. Wheeler has been appointed engineer of equipment Chicago Surface Lines, succeeding Charles Gordon, who resigned some months ago to become Western editor *ELECTRIC RAILWAY JOURNAL*. For the past two and one-half years Mr. Wheeler has been employed in the railway motor engineering department of the General Electric Company at Schenectady. He is a graduate of the school of engineering, University of Missouri, and has done considerable work in the shops of street railway companies and the Union Pacific Railroad at Sedalia, Mo.

J. L. Longino, vice-president and general manager of the Arkansas Light & Power Company, was recently elected president of the Arkansas Utilities Association at its sixteenth annual convention. It was early in the current year that Mr. Longino was made vice-president and general manager of the Arkansas property, advancing to that position from the one of operating superintendent. Two years prior to this he had been made manager of the Pine Bluff Company, an associated public utility which operates the electric railway, power and water services in Pine Bluff. His promotion of this year did not alter his association with the Pine Bluff Company as general manager, although he was relieved of some duties by L. B. West, auditor of the company.

Obituary

William H. Burk, secretary, treasurer and auditor of the Waterloo, Cedar Falls & Northern Railway, died suddenly at his home in Waterloo, Iowa, recently. He had been ill for the past two years. Mr. Burk was connected with the Chicago Great Western for some time, being general Eastern agent in New York City before going to Waterloo twelve years ago.

Alex G. Drury, Jr., nationally known mechanical and electrical engineer, died at his home in Cincinnati on Nov. 29. For the past ten years Mr. Drury had been engineer for the Cincinnati, Newport & Covington Light & Traction Company, which leases the electric railway systems in Covington and Newport, Ky., to the Cincinnati, Newport & Covington Street Railway, a subsidiary of the Columbia Gas & Electric Company. He was thirty-eight years old.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions

for Discussion of Manufacturing and Sales Matters

Much Welding Being Done

Manufacturer Reports Substantial Increase in Use of Thermit Process

Tangible evidence is at hand that track reconstruction work has continued at a fast pace during the year now drawing to a close. It will be recalled that more miles of track were rebuilt during 1922 than in any year previously recorded. The complete figures for 1923 will not be available for several weeks, but the pace that has been set is indicated from sources other than the railways themselves.

Among the manufacturers of track material reporting very satisfactory business this year is the Metal & Thermit Corporation. Its railway business has been 50 per cent greater this year than the best year. Not only this, but the company reports a substantial increase in the number of customers. To be more nearly exact, it had on its books this year three times as many customers as last year.

This expansion is attributed by the company to two things: (a) the constantly growing appreciation of the value of the Thermit rail weld and (b) the reduction in cost of installation through economies effected in carrying out the process. This cost, the company now reports, has been so reduced that it compares favorably with any other method of joining rails.

Perhaps the biggest order of the company has been for material for from 5,500 to 6,000 joints. This, by the way, was from a company still in receivership. This simply reflects again that the electric railways are rehabilitating strongly, even where the company may be in receivership.

Another large order received by the company was for material for about 5,000 joints. These, of course, are some of the outstanding installations. Orders for material from 1,000 to 3,000 joints have been plentiful.

The Metal & Thermit Corporation is more than optimistic about the prospects for business in the electric railway field in 1924. Its business, in this field is, of course, only a small part of the entire output of the company. In other lines, notably steam railway work, it also reports a substantial growth in business.

New Radial Line in Toronto in Prospect

The first spike was driven recently on the track to be laid by the Toronto Eastern Railway which was the initial step in the operation of a new radial

line running from Bowmanville to Toronto. It is expected that the line will be in operation by the end of next summer. Construction of the line was started in 1914. At that time the work was begun by the Canadian Northern Railway, but will be finished by the Canadian National Railways. When the war came construction activity ceased, but since that time Canadian National engineers have been occupied with working out the completion of the project. Originally tracks on the proposed radial were laid from Bowmanville to Whitby and grading on the right of way was completed from Whitby to Pickering, but the rails on the latter part were not laid. About a year ago Sir Henry Thornton, president of the Canadian National Railways, announced that he would have the road extended to Toronto and operated as a fast electric railway. Many distinguished people, including railway officials, were present at the ceremony of commencing the new rails.

Standardization Being Accomplished by Germans

The extent to which industrial life in Germany has been coordinated, it is said, is shown by the fact that more than 700 German national standards have been adopted. In addition to the work of the central body there are no less than sixty-five special industry committees actively working on such subjects ranging from the standardization of pipe fittings to sheet paving material and railway car construction.

A striking example is cited of the efficiency of national standardization as it has been developed in Germany in the case of a rush order placed with German manufacturers for 200 locomotives for delivery to Russia. Production of different parts was allotted to seventeen different manufacturers to be produced strictly upon the plan of interchangeable parts, no one manufacturer making a complete locomotive. No serious practical difficulty was encountered in filling the order. The inspectors made a particularly striking test of the feasibility and accuracy of the plan by ordering a complete locomotive to be assembled from parts chosen at random from the parts furnished by the seventeen manufacturers. It proved to be ready for service immediately after assembly without the necessity of any disassembling for readjustment.

"The extent to which Germany has so far succeeded in keeping her industrial machine intact is due in no small part to the elaborate scale on which her standardization work is performed."

So states Dr. P. G. Agnew, secretary of the American Engineering Standards Committee, in a bulletin which he has prepared for the committee.

Brill Declares Dividend

A disbursement of 1½ per cent was made on the common stock of the J. G. Brill Company on Dec. 1. The amount of outstanding common stock is \$4,810,000, on which there were no dividends paid from 1908 until March 1, 1923, when a disbursement of 1½ per cent was made. This dividend has been paid quarterly since. The price range of the common stock has been as follows:

	High	Low
1917.....	33	10
1918.....	27	18
1919.....	64½	19½
1920.....	63	24
1921.....	56	25
1922.....	59	36
1923.....	91	49

This year the company has had good business, the direct result of increased purchases by public utility companies.

Lumber Conference Reaches Conclusions

It is expected that trade in lumber products in various countries will be facilitated following the recent European Lumber Conference held in Bratislava. At the conference it was decided to establish a permanent European commission, composed chiefly of reputable lumber exporters, to which would be assigned the task of establishing a lumber trade Court of Arbitration. In the case of dispute and on appeal by both parties this court would render decisions which would be final and binding. A second decision of the conference contemplates the formation of a European association to be composed of the various European lumber trade associations. The conference considered also the matter of standardization of lumber sizes and classification, but took no definite action in this direction. Besides the Czech delegation there were present representatives from France, Italy, Austria, Germany, Holland, Switzerland, Hungary and Rumania.

Metal, Coal and Material Prices

Metals—New York		Dec. 4, 1923
Copper, electrolytic, cents per lb.....		13.125

Victorian Railways Invite Bids

The Victorian Government Railways, Melbourne, Australia, is inviting bids on the following machinery and equipment: Spring coiling machine and necessary equipment, including electrical motive apparatus; paper rolling machine, including electrical motive apparatus; combination turret lathe, including leading screws and nuts and taper-turning attachment; gear-cutting machine; automatic cross-cut saw; cross grooving and trenching machine; planing and thicknessing machine, including side cutters. A copy of the specifications covering this equipment may be consulted by interested manufacturers at the Boston or New York district offices, or at the Cincinnati co-operative office. Bids will close at Melbourne on Jan. 9, 1924.

Rolling Stock

Fort William Electric Railway, Fort William, Ont., during 1923 remodeled two single-truck and one double-truck one-man cars.

West Chester Street Railway, West Chester, Pa., built and rebuilt in the railway shop during 1923 four interurban two-man cars.

New York, N. Y.—The department of Plant and Structures is considering the purchase of new cars to supplement present service on the Williamsburg Bridge and also to provide for other service that will likely be taken over by the city.

Fonda, Johnstown & Gloversville Railroad, Gloversville, N. Y., during 1923 ordered two city double-truck two-man cars and one interurban two-man car.

Spokane United Railways rebuilt four one-man cars during 1923.

Salt Lake & Utah Railroad, Salt Lake City, rebuilt or remodeled during 1923 three insulated box cars, one tank car and one flat car.

Indiana County Street Railways, Indiana, Pa., ordered from the Kuhlman Car Company in 1923 three interurban double-truck two-man cars.

Northern Texas Traction Company, Fort Worth, during 1923 ordered from the American Car Company ten double-truck one-man cars. Twenty-two cars were remodeled, the Cincinnati Car Company remodeling twelve city motor double-truck one-man cars and the St. Louis Car Company rebuilding ten.

San Francisco, Napa & Calistoga Railway, Napa, Cal., during 1923 ordered from McGuire-Cummings one interurban steel locomotive double-truck car and one work car from the Pacific Car & Foundry Company.

Quebec Railway, Light & Power Company, Quebec, during 1923 ordered of the Ottawa Car Manufacturing Company, Ltd., ten single-truck one-man cars. Ten double-truck two-man cars were rebuilt.

Sacramento Northern Railroad, Sacramento, Cal., ordered during 1923 two electric locomotives from the General Electric Company.

Worcester Consolidated Street Railway, Worcester, Mass., during 1923 ordered ten double-truck two-man cars for city service from the Osgood-Bradley Car Company.

Track and Line

Trenton & Mercer County Traction Corporation, Trenton, N. J., will remove its switch on Brunswick Avenue to Harney's Corner in Lawrence Township.

Toronto Transportation Commission built in 1923 7.152 miles of new single track in pavement and rebuilt 7.774 miles.

Salt Lake & Utah Railroad, Salt Lake City, during 1923 increased its side tracks by 5,553 ft. of track none of which was in paved streets.

Alabama Power Company, Gadsden, Ala., will rebuild the Cansler Street line from Ninth Street to a point on Twelfth Street. Seventy-pound rail will replace the 40-lb. rail and the street occupied by the car line will be repaved. The Cansler Street improvement will cost from \$12,000 to \$15,000. Work is progressing on the rebuilding of the car line trestle over Black Creek on the Attalla line.

Wisconsin Public Service Corporation, Green Bay, Wis., rebuilt in 1923 2,500 ft. of city single track paved and raised to level with new ties and ballast.

Pittsburgh Railways built during 1923 0.467 miles of city single track and 0.025 miles of interurban track in pavement. In open construction there was built 0.171 miles of city track and 0.062 miles of interurban. The company rebuilt 34.326 miles of city track and 0.911 miles of interurban track in pavement and in open construction 1.028 city miles and 1.826 interurban miles.

St. Joseph Railway, Light, Heat & Power Company, St. Joseph, Mo., will extend the Wyatt Park line tracks 1,700 ft. on Thirty-third Street. An agreement to this effect was reached recently following a conference with the park board members and S. B. Irelan, general manager of the company.

Power Houses, Shops and Buildings

Sydney, Australia.—The railway commissioners are now receiving bids and placing orders for the power plant equipment, including a number of large turbo-generators and boilers for the electrification of the Sydney Suburban Railways. When installed the generating units will be the largest in Australia, each being of 20,000-kw. normal rating. It is expected that the electrification of the first section of the Suburban Railway system of Sydney will be completed by March, 1925.

Trade Notes

Morton Manufacturing Company, Chicago, manufacturers of the Acme line of railway appliances, has just completed an addition to its Chicago factory, giving it 18,000 sq.ft. of additional floor space.

Walter N. Ballou has been appointed manager of the transportation division of the Atlanta office of the Westinghouse Electric & Manufacturing Company. He will have charge of the light and heavy traction business of the company in that territory.

Western Electric Company, New York, N. Y., has announced important organization changes which involve the appointment of three new assistant works managers and two superintendents in the manufacturing department. These changes are part of a program of expansion being carried out in the new Western Electric works at Kearny, N. J., which in their ultimate development may duplicate the tremendous plant at Chicago. C. L. Rice, formerly production superintendent of the Hawthorne works at Chicago, and S. S. Holmes, general superintendent of installation of the installation department, have been promoted to assistant works managers at Hawthorne. R. C. Dodd, at present operating superintendent of the Hawthorne works at Chicago, has been promoted to assistant works manager at the new Kearny, N. J. works. This appointment is effective March 1, 1924. Other changes are as follows:

J. J. McKenna, formerly assistant general purchasing agent at Hawthorne, succeeds Mr. Rice as superintendent of production and **W. H. Meese,** supervisor of installation methods and results, succeeds Mr. Dodd as operating superintendent at Hawthorne.

New Advertising Literature

Linde Air Products Company, New York, N. Y., has just published an illustrated booklet of 122 pages fully describing the latest methods for various kinds of work. It states that the keynote of successful cast-iron welding is a thorough understanding of the necessity for adequate preheating, proper welding practices and suitable annealing. In many shops the application of advanced methods has accomplished saving in money, labor and time.

Ohio Brass Company, Mansfield, Ohio, has issued a pamphlet called "How to Save Time, Money and Temper!" "Cam yourself, Bill, cam yourself" tells about the advantages of using cam tips. These cam tips can be found not only on frogs but on Ohio Brass crossings, section insulators, strain plates, etc. The circular says that you can "cam up" your whole system, save time, money and temper and have all the cars rolling all the time.

Cost of Repair Parts Varies with the Times

RECENTLY, in discussing with an electric railway shop superintendent the advisability of the railway manufacturing for its own use various car parts made up in small quantities, he said that a check of costs which had just been completed showed that several parts previously made in the shop at a saving could now be bought outside cheaper. So orders were to be placed for them.

Labor and raw material prices are constantly changing, and what is economical repair shop practice at one time may be found to be costly at another. The margin of saving between making repair parts in an electric railway shop and purchasing them outside is frequently quite small and railways often make parts as a matter of convenience rather than take a chance of slow delivery. A frequent check of manufacturers' prices with the shop costs will show whether it is advisable to continue to make them or place orders with a manufacturer.

As manufacturers specialize in manufacturing work, and as they usually keep their plants equipped with the most modern labor-saving machines on account of trade competition, it ought generally to be possible for them to do such work cheaper than it can be done in an electric railway shop which is organized and equipped for maintenance work, and often has old tools to work with. Abnormal conditions may make railway manufacturing desirable at times, but a watchful eye should be kept for the opportunity again to buy maintenance parts outside more cheaply.

Cleaning Done Right Contributes to Low Maintenance

IMPROVED appearance and better sanitation are desirable aspects of good car cleaning, but a more important result is the contribution this makes toward preservation of the car structure. The importance of cleanliness has increased considerably with the greater use of steel car construction. Corrosion is the greatest enemy of steel and iron and the best protective coatings have their usefulness decreased enormously by lack of attention in keeping all parts clean.

Working to meet this maintenance problem, special consideration has been given in car construction to avoid pockets and crevices which collect dirt and moisture. Sanitary corners have been provided, moldings and projections are beveled and seat pedestals are made with well-rounded bases. But these precautions merely make cleaning easy and are of little help in eliminating corrosion unless the cleaning is actually done. The dirt which collects retains moisture. This combination forms an acid which accelerates corrosive action, where

steel is used, or soon rots away wooden construction. The corners are the hard parts to keep free from dirt, but they are the important points, if maintenance costs are to be held to a low figure.

Making Air Tanks Safe at Reasonable Cost

A GREAT deal of attention has been directed recently to the need for establishing definite specifications for the construction of electric railway air tanks. A committee of the American Electric Railway Engineering Association has been working on this subject and has been co-operating with a sub-committee of the American Society of Mechanical Engineers, which is engaged in the preparation of a code for the manufacture of unfired pressure vessels. This code will probably include electric railway air reservoirs.

Primarily, the object of such specifications is to insure safety. The railway companies should be, and are, in entire accord with this object, and it is to be hoped that the work under way will result in the production of a code which will not only assure safety but will also avoid saddling upon the railways an unnecessarily expensive and heavy equipment to be hauled around throughout its life.

The interest of railways goes farther than providing a construction that will be safe when first installed. In addition, the construction of air tanks for electric railway service should be such that easy, systematic and regular inspection and tests can be made. These are necessary in order to be sure that the deterioration resulting from service has not weakened the tank to a points where blowouts are likely to occur.

The present inspection and test practice of electric railways usually consists of some kind of a pressure test or a close visual inspection of the material of the tanks on the outside after all loose scale and dirt have been knocked off with a light hammer. Some roads apply pressure with a hydraulic pump, but on many roads the pressure test consists only of setting up the safety valves and pumping up the air pressure to an amount considerably in excess of that regularly obtained. Some roads have a practice of periodically rotating the reservoirs so that excessive corrosion will not take place at one particular section of the shell.

The need for an inspection of the interior of the tanks has been felt for some time, but as the usual pipe connections are seldom larger than 1 in., the opening is too small for inspection purposes. A few railways are now using tanks with a 2-in. pipe connection in one head. This makes it possible to examine them internally, as a drop light with small sized lamp can be inserted. With this better means of inspection it should be possible to utilize a lighter gage of metal for

the tank than might be considered necessary with only exterior inspection.

In addition to the better facility for inspection, the 2-in. connection can be used to advantage for providing a moisture trap in the air piping to prevent freezing of the condensed moisture at points that will interrupt the air supply.

Due to advances made in welding, a large field has been opened up for the application of this process to air reservoirs. Some engineers have felt that a welded tank increased the hazard, but with provision for careful, systematic inspection and test after installation, no doubt a satisfactory welded tank can be made at a lower cost than a riveted tank (which some members of the A.S.M.E. are inclined to feel is necessary) and perhaps with lower weight, while giving an adequate safety factor.

Having provided for adequate tests to insure safety, why not tell the public about it? It has been suggested that a very effective method of doing this would be to stencil a statement conspicuously on the outside of the tank which would read something like this: "Tested to $1\frac{1}{2}$ times maximum working pressure," accompanied by the date and name of company.

While the general public is not competent to judge as to the frequency with which such tests should be made, a stenciling of this nature would at least indicate that the tank had been tested at some time and it would also serve as an incentive for the railway to make tests well within the proper interval.

Public Beginning to See that Riders Alone Cannot Support Subways

ONCE every so often some one proposes that the elevated roads, or part of them, in large cities be taken down. Scrapping is the word generally used. The obstruction which they cause to light and air on the streets below and to adjoining property is the principal argument urged against the existing structures. During the past week agitation of this kind has again come up, this time in connection with the Sixth Avenue line, New York City. Julius Miller, borough president of Manhattan, has gone somewhat further than has been done with previous proposals of a similar nature and has suggested that the cost of acquiring the structure and building a substitute subway be raised by assessments on abutting property. He believes not only that the increase in value of this property resulting from the change will amount to much more than the entire cost but that the owners of this abutting property would be willing to pay for the change by an assessment. The amount required has been estimated by him at 10 per cent of the assessed value of the property.

Now, it is undoubtedly true that in the course of the growth of a city the methods of transportation in use may have to be changed. Undoubtedly, also, property owners prefer a subway to an elevated railway on the street on which their real estate is located. The elimination of the overhead lattice work of steel girders, ties and rails on Sixth Avenue would improve the appearance of the street and make the ground-floor stores much lighter. With the railway underground there would be a pleasing reduction in noise. It is easy to see, therefore, why the property owners on that avenue favor such a step.

However, grave misgivings may well exist concerning several features of the plan. The estimated cost seems too low by a large amount. The existence of an underground railway, the Hudson & Manhattan, under Sixth Avenue from Ninth Street to Thirty-third Street, would seem to impose great engineering difficulties in the design of a new subway. Apparently no detailed estimates have been made of the traffic which would be carried, nor the cost of operation, nor who will operate the line. It has simply been assumed as a matter of course that a Sixth Avenue subway would be a paying proposition.

Actually, of course, a subway is a luxury in any city. Even in Detroit, where the subsoil is ideal for subway construction because it contains no rock but can be cut like cheese, the cheapest form of subway, if supported entirely by the car rider would require a fare of 10 cents or more, according to D. L. Turner. This suggests that at least one good result may come from the campaign on Sixth Avenue, even if the subway is never built. A large number of more or less influential people will learn at first hand something about the intricacies of subway building and its tremendous cost. They will discover the thousand and one things that are required, and to which the average man never gives a thought. And if careful analyses are made of probable operating costs and passenger revenue, these property owners may learn that every railway is not *ipso facto*, a gold mine. The plan is commendable in that Mr. Miller is going about the work in the right way, namely, by placing some part of the cost of the construction on the owners of abutting property. They primarily are the ones benefited. The principle of assessment for rapid transit improvements, suggested also in Mr. Turner's report on Detroit as presented in this paper last week, is logical.

Finally, it is evident that even if the campaign for funds among Sixth Avenue property holders is successful, New York cannot dispense now with the carrying capacity of the Sixth Avenue elevated. The city is ten years at least behind in its transit program. If the building of a subway under Sixth Avenue takes five years the elevated will have to remain in place for at least that length of time because the other present north and south rapid transit lines have not the excess capacity required to accommodate the passengers who now use the Sixth Avenue elevated. After a Sixth Avenue subway is built, it may be that the elevated over the street will not be required, but if history is any guide, New York City will need for many years all of the rapid transit lines which it has now and can build to care for its constantly increasing traffic.

This condition, that the means of transportation is a step behind the demand, applies in every growing city, and is one of the safeguards of the electric railway. Thus there have been statements in the past that the surface lines in New York were obsolete and should be scrapped. Nevertheless, they carry now about 39 per cent of the local business of the city, as compared with 59 per cent on the rapid transit lines and 2 per cent by buses, and there is no other way known of taking care satisfactorily of this large proportion of the traveling public. In other words, good transportation in a city is a necessity, and a city cannot get along without electric cars in its principal streets until a better means for local transit is provided. This seems a long way off.

Use of Mold Successful in Arc Welding Copper Rail Bonds

Two Methods of Arc Welding Are Described—The First Employs a Carbon Electrode and the Second a Copper Alloy Rod—Figures of Numerous Bond Tests Are Given—Procedure Has Been Developed as a Result of Research Covering Three Years

By Chester F. Gailor

Consulting Engineer, New York City

ONLY recently has the practice of arc welding bonds to rails been accomplished in a reliable and satisfactory manner. The first attempt to arc weld copper bonds to rails was made by using, both for the bonds and the filler needed, pieces of old trolley wire welded by the carbon arc method. It was considered necessary at that time to secure deep penetration into the rail steel to produce a desirable weld. This caused unnecessary gouging and burning of the steel, and usually resulted in an ugly looking weld of questionable character. A careful study of the factors involved demonstrated the fallacy of this practice and resulted in the development of a welding process which eliminates that feature.

Many attempts have been made to manufacture a rail bond with a suitable terminal which could be satisfactorily welded to the rail without the use of a mold. This has been found very difficult because the copper, in a fluid state under the influence of the arc, does not amalgamate readily with the steel. Copper in such a small mass usually will chill without producing a weld. The use of molds, however, has made it possible to use sufficient copper around the bond to produce a reliable weld and at the same time form a suitable terminal on the bond.

The problem of confining the weld metal and the necessity for producing a weld and bond terminal of a suitable character prompted the use of a mold. It was soon found that a carbon mold met the requirements better than any other material. Carbon will withstand the action of the arc and erosive action of the metal when boiling in the mold and will not chill the metal as rapidly as will most other materials. Consequently, a carbon mold in one form or another has been in use since the very beginning of this method of bonding.

It was found difficult to produce a satisfactory weld in the remote corners of the mold, especially on the smaller sizes of bonds with limited area of contact. In some cases where molds of other materials than carbon were used for experimental purposes, it was found difficult to force the copper metal into the corners of the mold, as the material had sufficient chilling and repulsive action to hold the copper back for an appreciable distance from the corners. This indicated that acute angles in the mold and thin sections of copper welding should be avoided.

The carbon molds are designed to produce a terminal and welded contact to the rail equal to at least four times the cross section of the copper metal in the bond itself. With this area it is virtually impossible for an operator to apply a bond which when finished will not test 100 per cent efficient. A larger contact terminal could not be justified.

Condition of Rails and Bonds After Being Subjected to Severe Drop Tests

During the study it was found that a combination of copper, steel and carbon for the mold was most desirable. It developed that the mass of carbon needed around and under the head of the bond was considerably more than the space available between the finished bond terminal and the top, which many heavy-section joint plates now in use, would permit. The combination of these materials, however, enables the bond to be applied at a point on the rail head much lower than if an all carbon mold were used.

The life of such carbon molds of course depends largely on the welder. A set of carbons will, as a rule, weld forty or fifty bonds. When the speed of the operation is considered the use of molds is fully justified.

Investigation and research conducted principally in the laboratories of the Rail Welding & Bonding Company resulted in the development and perfection of two different methods. One method is by the use of the carbon arc including the use of reversed polarity, with the carbon electrode negative. Instead of using scrap copper for an electrode, a copper alloy welding rod is employed, which contains a combination of metals act-

ing as a strong deoxidizer for both steel and copper. Under the influence of the arc this will thoroughly cleanse the steel surfaces, bringing pure copper into contact with the steel in the rail under the most favorable conditions.

This action of the copper alloy rod obviates the possibility of gouging the rail steel. In fact, the best bonds are produced where the arc is drawn along the surface of the rail steel, close enough to secure the desired weld, but still far enough away to avoid any direct penetration. The action of the copper metal in the mold under the influence of the arc is very similar to that of copper when handled in a crucible. All the foreign substances and slag rise to the top, leaving the pure copper forming the bond terminal welded to the rail. This method is recommended in all cases where dynamotors and similar low voltage generating units supply the necessary electric current. The total time

Path Which Arc Should Follow in Welding Bond

for welding a bond of the ordinary standard size and type is approximately two minutes. Where conditions are sufficiently favorable bonds may be installed in half the time. It has been found very essential that sufficient current be available to keep the copper metal flowing uniformly and the metal in the mold always in a fluid state. Otherwise, the metal will chill, preventing the cleansing and boiling action, which is highly necessary. In practice at least 200 amp. are required to weld bonds successfully with this method.

METALLIC ARC WELDING

The second method of bond welding, which is the result of a research started about three years ago, is distinctly different. In this the welding metal must all be kept in a molten state and the length of arc changed from time to time to produce a good weld. The same molds and accessories are employed as in the first method. The current usually is supplied by a lightweight portable resistance welder, a $\frac{1}{8}$ -in. diameter copper alloy rod forming the positive electrode.

The resistance should be set to permit a current of about 225 amp. The weld is commenced at the end of the mold remote from where the bond head projects into it. The arc is struck by touching the electrode to the mold. A globule of melted copper will start to form at the end of the mold and the arc should be kept at the front edge of the globule, allowing it to enlarge until the entire bottom of the mold is covered. An

arc of about $\frac{1}{4}$ to $\frac{3}{8}$ in. in length is ordinarily used at the beginning of the job. As soon as the arc touches the bond head it should be shortened to $\frac{1}{8}$ in., as the short arc is necessary to melt down the copper of the bond head properly. After the bond head is melted down the arc is played back and forth and in and out from the rail over the entire head to keep all the copper in a molten state and insure that the head is well filled out in back and properly welded to the rail. This procedure is followed whether the bond is applied to the head, web or base of the rail. When applying the weld to the base a slightly longer arc, $\frac{3}{8}$ to $\frac{1}{2}$ in., is used at the beginning to fill the mold.

MECHANICAL TESTS

During the development of the process it was found necessary to make mechanical tests in order to establish the principles involved, and also to get some idea of the comparative life of the various types of bonds. The vibrating machine used for testing bonds mechanically consists of a steel framework carrying two upright standards mounted on eccentrics in such a manner as to give a maximum movement of $\frac{3}{16}$ in. between the two members. The bonds were welded to pieces of steel and inserted between the two upright members and the machine operated continuously until failure occurred. This movement, being far in excess of that resulting from actual practice, was adopted in order to speed up the operation. A summary of several of such tests is shown in an accompanying table.

Several methods of testing the strength of the bond heads when subjected to shearing stresses such as are apt to be imposed upon bonds welded to the head of rails were tried with varying results. The most valuable of those tried was a simple shear test to show the relative strength of the weld and the copper forming the bond terminal. This test clearly indicates the merits of the weld, as the loads required to shear the bond terminals all ran over 30,000 lb.

The use of a sleeve at the junction of the bond head and bond itself was shown to be very valuable. This sleeve and the head on the bond itself hold the strands and laminations in one solid mass, preventing the welding heat from overheating any individual strand and at the same time throwing the bending action back into the flexible portion of the bond. This particular feature was found to add practically 25 per cent to the life of the bonds.

ELECTRICAL TESTS

Reliable resistance tests of welded bonds were difficult to make, as it was found after a preliminary investigation that there are very few instruments available which could accurately measure the resistance in the contact between the welded copper bond head and the rail steel. The following is a brief summary of resistance tests which include 1 in. of steel at each bond head and the bond itself. No fish plates or mechanical connections were used so that these results show the actual resistance of the bonds enumerated in the accompanying table.

RESULTS OF MECHANICAL TESTS OF WELDED BONDS			RESULTS OF ELECTRICAL TESTS OF WELDED BONDS		
Size	Type of Bond	No. Vibrations Before Failure of Bond	Size	Type of Bond	Ohms Resistance
7-in.	0000 laminated U.	5,100,000	6-in.	0000 laminated U.	.0000389
9-in.	0000 Webber U.	2,403,000	7-in.	0000 laminated U.	.0000493
8-in.	Single cable U.	1,830,000	8-in.	Webber.	.0000454
8-in.	Double cable U.	1,050,000	8-in.	Single cable U.	.0000516
			8-in.	Multiple cable U.	.0000484
			8-in.	400,000 circ. mil single cable U.	.0000260

Careful consideration was given to the study of the rail steel at and adjacent to the point of weld. The idea of securing even the usual penetration when making a bond weld was found not only decidedly wrong from a bonding point of view, but it created a condition that proved liable to cause failure in the rail section when mechanical tests were conducted. The improvement in the process of welding, as outlined herein, quickly eliminated this feature, by making it both unnecessary and improper to penetrate the steel with the arc.

Among many other tests which were conducted to prove that the welding of copper bonds to steel rails with these processes of welding did not weaken or materially affect the structure were severe drop tests made on extra high carbon tee rails by dropping the 2,000-lb. tup so as to strike the rail at the point of weld. No failures or indications of any objectionable character were in evidence at the conclusion of these tests. The rails were removed from the testing apparatus because of the excessive vertical deflection which caused the rail to rest on the bed of the machine.

Aside from the area heated during the welding, which was in no way damaged, there was no evidence of any change in the structure of the steel or the rail section itself.

Systematic Inspection Reduces Pull-Ins

THERE has been a steady reduction in equipment failures, covering a period of several years, on the Eastern Massachusetts Street Railway, formerly the Bay State Street Railway, which operates 665 miles of city and interurban lines. This dated back to the reorganization which placed the road under state control with operation by a board of public trustees. An

accompanying table shows a reduction from a maximum of 1,489 pull-ins due to equipment failures in July, 1920, to 92 in July, 1923.

This marked improvement in the record in three years is due to numerous changes in methods, but according to W. C. Bolt, superintendent of rolling stock and shops, they all can be summarized in the words "systematic maintenance and inspection."

Cars are given a general shop overhauling at between 60,000 and 75,000 car-miles, depending on the type and age of cars. Between these general overhauls the cars are inspected every 1,000 miles at the carhouse for minor adjustment and repair. It is stated that this plan, vigorously followed, has made it possible almost to eliminate failures of equipment in service and substantially to reduce the cost of maintaining cars.

The comparative record of pull-ins by operating divisions for the month of October, 1923, shows considerable difference in the records of the various parts of the system. Two of the smaller divisions had perfect records for the month, and two of the larger stations had but one pull-in each due to maintenance, averaging 0.007 pull-ins of this character per 1,000 car-miles. From this the number of pull-ins for the various divisions ranges up to a maximum of thirty-six, or 0.184 maintenance pull-ins per 1,000 car-miles.

Publication of the monthly record is said to have created considerable competitive interest, and has been a contributing cause to the present good record. Equipment failure pull-ins are also analyzed carefully each month, as indicated in another table. The company makes this record up for each operating division, although only the total is shown in the table. This enables the department heads to determine the causes that result in car failures and to eliminate the sources of trouble.

PULL-IN REPORT, EASTERN MASSACHUSETTS STREET RAILWAY
MONTHS OF SEPTEMBER AND OCTOBER, 1923

Reclamation Storeroom Accomplishes a Big Saving*

The System Developed by the Northern Texas Traction Company for Reclaiming Waste Material Has Improved Efficiency of Mechanical Department and Reduced Expenses

ON MANY railway properties thousands of dollars a year have undoubtedly been thrown away via the junk pile. Further losses have resulted from lack of a system whereby a single person passes on all material before it is scrapped. If so-called waste material is examined to see whether or not it can be reclaimed and restored to usefulness, large savings can often be made in material which would otherwise be drawn from stores.

This problem was the subject for discussion at a meeting of the master mechanics of the Stone & Webster companies some time ago. As a result of this discussion, it was decided that the Northern Texas Traction Company, Fort Worth, should experiment with the establishment of such a department.

A survey was made of conditions at the shop and it was found that material and spare parts were lying around everywhere. This material had been taken off the cars from time to time and left there with the idea that it would be used at some future date. Time and effort were being lost, however, in looking for what was wanted and, in a great many cases, material was requisitioned from the storeroom when a thorough search would have discovered the desired article in some corner of the shop. This was the inevitable result of having no centralized place equipped for handling second-hand material and reissuing it. Moreover, it was felt that proper examination was not being made before material went to the junk pile.

A section of the truck shop 40 ft. x 36 ft. was therefore partitioned off and some 350 shelves of various sizes were built. Scrap cupboards, waste bins, spare controller racks, glass racks, 560 small bolt bins and an armature rack were placed in this room. A work bench was installed and equipped with a vise, compressed air connections and other tools for reclaiming material needing minor repairs. Surplus material and spare parts were collected and moved into this room, assorted and put away. The room thus assumed the appearance of a storeroom, although all the material belonged to the mechanical department and not to supplies.

A man who had had previous experience in the store-room, as well as in the shop, was placed in charge of this reclamation room under the supervision of the master mechanic. Another man was kept busy scrapping material, stripping good parts from junked material and making minor repairs. The latter man, with the assistance of the general foreman, determines whether or not worn parts that are brought in are worth reclaiming. When they are, they are taken to the department where the repairs are made, and then returned to the reclaiming room for reissue. A third man, who is an all-around mechanic, puts in a portion of his time in this department, making miscellaneous minor repairs.

A rule was made in the mechanical department that if any man in any department needs material or parts, he must first apply to the reclamation room to ascertain whether or not the material desired is to be had there. If not, the man in charge of the room has authority to

write a requisition on the general storeroom. By this plan the general foreman is relieved of much detail work.

The establishment of this department has resulted in saving time in the reassembling of cars and in furnishing more accurate jobs. When cars are brought into the shop for overhauling all parts are removed, repaired and stored in this room. When the car is completed the same material is placed back on the same car, after, of course, it has had the necessary attention.

It is impossible to place a monetary value on some of the benefits derived from the establishment of this department, such as relieving the foreman of detail work and permitting him to give closer attention to other duties, relieving congested conditions in the storeroom and reducing the amount of clerical work in that department, and systematizing the use of material, both new and used. In some other respects, however, the saving in dollars and cents is quite apparent. A check made of the orders for March, 1923, showed that about 56 per cent of the calls for material were supplied by the reclamation room. But it is felt that the other benefits derived from it would be well worth while even with no saving at all in money.

Repairs to Car Bodies Principal Expense Item in Railway Shops

FIGURES recently made public by the Department of Commerce show that nearly 80 per cent of the money value of work done in electric railway shops is expended in repairs to cars. In 1921 the sum of

¹ Includes value of 2 electric locomotives built.

² Includes values of 1 electric locomotive built.

³ Includes value of 3 electric locomotives built.

\$69,131,546 was spent in this way. Repairs to motors, etc., was the next largest item, but the expenditure on this account amounted only to \$7,226,905. A total of 177 cars, including passenger, freight and others, was built in electric railway repair shops, but the value of the equipment was only slightly more than \$1,000,000. It appears that the railways are generally following the practice of using their shops for maintenance work and going direct to the manufacturer when they want new cars.

Pouring the Concrete Track Base and Leaving Openings Under the Tie Plates

How the Concrete Is Distributed and the Under-Tie Openings Made with Shovels

Insuring a Bearing Under Steel Ties

Opening Is Left Under Ties When Pouring Concrete and After It Sets Space Is Filled in with Special Mix and Thoroughly Tamped

THE Cleveland Railway Company has worked out an improved method of placing concrete under steel ties in new track construction. There is always more or less difficulty, under the usual scheme employed, of getting the workmen to tamp the concrete under and around the steel ties to make certain of a complete bearing. Unless the operation of mixing concrete is followed very closely by continuous inspection, the workmen will make the mix too soft, in order to make it flow under the plates easily, and this reduces the strength of the concrete.

Under the new plan worked out by Charles H. Clark, engineer maintenance of way, a space about $1\frac{1}{2}$ in. deep is left under the tie plate when pouring the concrete base, and this is allowed to set around the channels. After this has set for two or three days, the open space under the tie plates is filled in and tamped with power tampers, the material used being a mix of slag screen-

ings and cement in the proportion of 1 to 3, slightly dampened.

While the concrete base is mixed in a power mixer, as shown in one of the illustrations, the slag screenings are mixed by hand as used. A Jackson electric four-

The Concrete Base Is Permitted to Set in This Form for Two or Three Days

tamper outfit was used for compacting the special mix under the ties.

This new method of concreting the ties under the bearing plates increases the expense of construction slightly, but the assurance of having the ties in com-

Pouring the Concrete Track Base and Leaving Openings Under the Tie Plates

Closer View of Electric Tamping Tools Working Special Bearing Mix Under the Tie Plates

plete bearing more than justifies this added cost, Mr. Clark believes.

The new 102-lb. section 516 rail developed by the Cleveland Railway Company and laid with International steel ties is shown on page 1005 as installed on Quincy Avenue, Cleveland. The rails are given the standard tilt of 1 in 25.

Good Reports of Ciment Fondu Confirmed

**Boston Elevated Railway Finds the Tensile Strength to Be Satisfactory at the End of Six Months—
The Results of Tests Made in England Are Also Given**

TESTS made by the Boston Elevated Railway to determine the tensile strength of Ciment Fondu at the end of six months showed a figure slightly lower than that obtained at the end of three months. The earlier experiments with this material, which is a quick setting cement, were described in the *ELECTRIC RAILWAY JOURNAL* for Sept. 15, 1923. It was noted at that time that the strength at the end of three months was somewhat greater than at the end of twenty-eight days, although it was not quite up to the strength

7,930 lb. per square inch was developed, and at the end of ninety days this had increased to 9,100 lb. per square inch. From records of previous tests of portland cement concrete at ninety days it has been determined that 5,000 lb. per square inch represented exceptionally good performance.

Heretofore Ciment Fondu has been used in the same proportion as portland cement, but experiments made in France indicate that it is in reality not necessary to use as much of the new material as of portland cement. The mixture used there consisted of 800 liters of gravel and 400 liters of sand mixed with 300 kg. of portland cement and with either 300 kg. or 200 kg. of Ciment Fondu. The cubes made with the portland cement at the end of three months broke under a load of 155 kg. per sq.cm., while at six months they broke at 163½ kg. per sq.cm. Similar cubes of Ciment Fondu at the end of three days had a strength of 324 kg. per sq.cm., or nearly double that of the portland cement concrete at the end of three months. At the end of three months this value had increased slightly. The weaker mixture containing 200 kg. of Ciment Fondu developed a strength at the end of three days of 242 kg. per sq.cm.; at three months 252 kg. per sq.cm., and at six months 257 kg. per sq.cm. This cement is now being used in construction work by the city of Paris, the P. L. M. Railway and the Ouest Railway.

Not only its quick setting qualities, but also the fact

TESTS MADE BY BOSTON ELEVATED RAILWAY									
Tensile Strength 1 to 3 Mortar in Pounds per Square Inch									
Fifteen hours	Twenty-four hours	Forty-eight hours	Four days	Seven days	Fourteen days	Twenty-eight days	Three months	Six months	
302	360	393	457	472	500	413	469	458	
280	340	386	445	507	520	455	448	429	
315	372	375	482	478	490	433	460	446	
Av. 299	357	385	461	486	503	434	459	444	

shown at earlier periods. Although the reports now available show the cement at six months to be slightly weaker than at three months, nevertheless the tensile strength of Ciment Fondu appears to be holding reasonably constant. On the whole the company believes the tests so far made to be most satisfactory. Average figures for the results of these tests at each of the periods noted are given in the accompanying table.

Interesting experiments made in England with Ciment Fondu are described in the Oct. 18 issue of the *Tramway & Railway World*. The tensile strength of neat Ciment Fondu at the end of twenty-four hours was found to be 811 lb. per square inch, as compared with 91 lb. per square inch for neat portland cement of the same age. A mixture of 1:3 Ciment Fondu and sand developed a strength of 573 lb. per square inch at the end of twenty-four hours, whereas a similar mixture of portland cement and sand developed only 11 lb. per square inch. The Boston tests developed a strength of 432 lb. per square inch for neat Ciment Fondu at twenty-four hours. At the end of seven days in the English tests neat Ciment Fondu had a tensile strength of 1,003 lb. per square inch. Mortar in a proportion of 1:3 at the same age had a strength of 612 lb. per square inch. It will be seen that all of these figures are considerably higher than those obtained in the test made by the Boston Elevated Railway. This may have resulted from a variation in the methods of making the tests or in the material.

Tests were made to determine the crushing strength of 6-in. cubes of concrete in which Ciment Fondu was used. At the end of twenty-six hours a strength of

that a smaller quantity can be used as a substitute for portland cement, make Ciment Fondu a material of particular interest to electric railways for use in track construction.

The author of the article in the *Tramway & Railway World* says that once its practical advantages when used on a large scale are established it will have a revolutionary effect on concrete construction works of all kinds.

A Modern Electric Train in Cairo, Egypt

These Egyptian motor and trailer trains may not compare in capacity with American rolling stock standards, but they probably are superior in the speed with which they can be loaded and unloaded—judging by the number of doors rather than the characteristics of the people.

Good Results from Lettering Signs by Silk Screen Process

Details Are Given for Making Stencils and Frames, for Mounting to Save Time and Labor, for Applying the Color, Making the Squeegees and for Handling and Drying the Signs After They Are Lettered

ALL electric railways use signs in considerable quantities and must reletter them at quite frequent intervals to keep them in readable condition. In addition, the publicity campaigns which are now such an important part of the work of many railways require posters and cards in such quantities that careful attention must be given to their production.

Many methods for lettering are used by the sign departments of electric railways. A common one consists of first laying out the letters on cardboard and perforating this so that by forcing white lead through the perforation outlines of the letters are obtained on the sign surface. The letters are then filled in by hand. Where the same lettering is used in large quantities or at regular intervals stencils are frequently made with the letters cut out. Then by going over these with paint and a brush the letters are placed on the sign. With this method some lines are left on the letters which require filling in by hand as the center parts of the letters on the open stencil must be supported. This filling in by hand takes fully as much time as the stenciling.

To overcome some of these difficulties and reduce the time and labor for lettering, the silk screen process has been developed. It has several advantages over the stencil and hand process. There is a marked saving in the time required to complete a job, and as the lettering produced is built up, it has a far higher visibility than ordinary brush work.

The silk screen process consists of using a stencil of silk with the letters or designs laid out on it and the outline around the design filled in with a "cut-in" solution, so that later in using this as a stencil the paint used for the lettering or design will not pass through the silk where the solution was applied. This process is now being used by a considerable number of electric railways, among which are the Los Angeles Railway Corporation, the Pacific Electric Railway, the Brooklyn-Manhattan Transit Corporation, the Terre Haute, Indianapolis & Eastern Traction Company and the Indianapolis Street Railway. Most of the problems which have arisen in connection with the system have been solved.

The equipment for lettering signs by the silk-screen process consists of the silk stencil stretched on a sub-

Squeegeeing White Lead Through Silk Screen Stencil in Sign Lettering Work

stantial frame; a mounting to hold different stencils so that they can be quickly placed over the sign while it is being lettered, and raised again so as to insert another sign, and the squeegee for forcing the paint through the stencil and onto the sign. Practices found successful for cleaning the silk, fastening it to the frame, making the frame, filling in around the letters on the screen, and mounting for rapid handling follow. The practice used in the shops of the New York Rapid Transit Corporation for maintaining signs by this process is given as a definite procedure which has worked out satisfactorily.

Various materials have been tried as the fabric on which the design is laid out in this process, but silk bolting cloth has proved preferable to other fabrics. The mesh runs straight, retains its shape and is uniform and even. Considerable strength is also required in order to withstand the strain of squeegeeing the paint through the fabric, and silk bolting cloth holds up exceptionally well. Kress & Company, Brooklyn, N. Y., have made a special study of the desirable characteristics for a bolting cloth to be used with this process and are furnishing much of the material used at the present time.

Before laying out the design, the silk is stretched upon a wooden frame in a manner quite similar to that

Framework for Supporting and Operating Stencil

At Left—Raised position with signs in place. At Right—Stencil lowered, ready to receive white lead.

used by artists in attaching canvas. The frame should be made a few inches wider than the size of the design to be reproduced. Some additional space is necessary to hold the paint during the operation. The frame should be made in a particularly substantial manner and well-dressed strips approximately 3 in. x 3 in. have been found quite satisfactory. The corners should be mitered and corner irons used to keep the frame in shape. It is essential that the surface of the silk screen be flat, and so of course the frame must touch on all four sides if properly made. The actual dimensions of the frame will vary with the size of the design to be lettered.

An accompanying illustration shows several signs as used by the New York Rapid Transit Corporation, which vary in size from that necessary for a single destination sign to frames about 2 ft. x 3 ft. used for lettering routing and destination signs for operation involving a large number of routings.

PREPARING THE SCREEN

After the silk is stretched tightly, it is quite essential to cleanse it and make certain that all grease or other foreign matter is removed, which may get onto the silk during the mounting operation. This can be accomplished by saturating thoroughly with either hot water, alcohol or benzol. The letters or design are then laid out on the screen. Usually, this can best be accomplished by laying out a sketch on some convenient material and then by laying the frame face down against

this sketch, so that the letters can be traced upon the silk with a lead pencil. The traced design is then cut in by either leaving the silk mesh solid and the lettering open or by painting in the design or lettering solid and leaving the mesh open, it being understood that the open portions are the ones through which the paint is forced. A cut-in solution which has proved entirely satisfactory consists of $\frac{1}{2}$ lb. of English drop black dry, or bone black dry, dissolved in a quart of good orange shellac, with a tablespoonful of castor oil or other essential oil added to make the shellac pliable so that it will not chip out under the squeegeeing process. The New York Rapid Transit Corporation uses a tablespoonful of powdered black and 1 oz. of glycerine to a gallon of orange shellac. The cut-in solution will thicken while using and can be thinned by the addition of ten parts of alcohol and two parts of castor oil. A pyralin or liquid celluloid solution is sometimes used, but this is not as dependable as the one just given, as it is necessary to coat both sides of the silk. This pyralin mixture, however, is of particular advantage where it is desirable to clean out the screen for other use. This latter solution is made by mixing pyralin red No. 65/5 with a very small quantity of Du Pont thinner No. 12138. A black solution is made by mixing pyralin black No. 67/2 in the same manner. Celluloid solutions are highly inflammable and it is essential to keep them away from open flames.

The cut-in solution is best applied by a small camel hair or sable brush. When working on a flat surface, a bridge or hand rest will be found of advantage. When the design is finished, the frame should be raised about half an inch, so that the silk will not touch the top of the table or bench. Strips tacked temporarily to the end of each frame will give the desired effect. These should be removed as soon as the screen is coated with the cut-in solution. It is almost impossible to coat in with the solution around the edges where the screen rests against the frame. A satisfactory method for protecting these places is by the use of paper glued on and then shellacked. A lining of paper 4 or 5 in. wide can be glued to the inside of the frame so as to extend down over the face of the screen. Several strips of very thin paper will be found to work more satisfactory than a single sheet of thicker paper.

MOUNTING OF FRAME ESSENTIAL

When the frame with screens has been properly assembled, the next essential is an additional mechanism for holding the frame and for moving it into and out of position quickly. For the smaller sizes of frame some sort of a hinged mechanism has proved very efficient. An accompanying illustration shows the mechanism used by the New York Rapid Transit Corporation for holding the smaller sized frames which are

Equipment Used for Removing Paint and Washing, Dipping and Drying Steel Signs

The potash cleaning tank is shown at the extreme left. Signs are washed in the tank in the center and are then raised to the racks immediately overhead for drying. When thoroughly dry they are dipped in the small tank at the right end of the washing tank. This contains body color for the flat surface of the sign. After this dipping they are placed in the racks at the right for drying.

used for lettering the steel destination signs in its elevated cars. This framework is of 3-in. x 1-in. wood and is about 3 ft. long by 2 ft. wide. Two strap iron hinges are fitted to either side of the portions which hold the printing frame. The other end of these hinges is attached to the supporting base. The frame can thus be raised and pushed back out of the way while the sheet iron sign is being reversed or a new one placed in position.

Two small handles on either end assist in the operation. The frame which holds the silk stencil is fastened to the movable part of this framework by two hand screws, so that where it is necessary to change frames, this can be accomplished very rapidly. The entire operating mechanism is arranged so that it can be placed on a table or bench for support, which will bring it to a convenient height for rapid operation. The supporting base has a sheet iron stop at the rear end, which prevents the frame from being pushed back too far when in the raised position.

The supports for the signs to be lettered, of course, will vary with different types. For the sheet iron signs just referred to, a wooden framework is made, so that the signs are supported at the edges. This is essential as both sides of these signs are lettered, and after one side has been lettered it is placed with the lettered side down, so of course it is essential that this does not rest on anything that would smear the lettering.

HOW SIGNS ARE MAINTAINED

As this type of sign is used in large quantities, it is necessary to reletter at intervals. The facilities for handling this maintenance work and carrying it on rapidly are particularly interesting. When the sheet iron signs are received for relettering the first operation is to clean and remove the old paint. This is done by placing them in a potash solution over night. The potash tank is installed at one end of the room and the signs are hung on rods by wire hooks. These rods have small grooves so as to keep the signs spaced the required distance apart. Fourteen signs are thus handled at one operation. A large quantity are placed in the tank, and after the paint is loosened it is washed off in a washing tank, which is adjacent to the potash tank. A small overhead traveler is arranged with pulley, so that the rods with the signs attached can be lifted out of one tank and placed in the next. After washing, they are raised just above the washing tank to a wooden framework, on which they are allowed to remain while drying. Just at the end of the washing tank is a dipping tank, which contains the flat body color. When the signs are dry, they are dipped in this tank and then placed on the drying rack. This rack is made of angle iron and the round cross-rods which support the signs extend from one side to the other, while the signs hang down in between. Signs are taken from the drying rack after dipping and are placed in the frame for lettering by the silk screen process. After they are lettered they are dipped in varnish, and after drying are ready to be sent out.

The use of the silk screen process for this class of work has resulted in marked economy on this system. The lettering is now done on a piecework basis and the labor rate is 2½ cents per sign. Previous to the installation of this system, the lettering of ten signs was considered a day's work for one man, and the average cost per sign was in the neighborhood of 65 cents.

Several other arrangements are used by different

Several Sizes and Types of Silk Screen Stencils

railways for holding and operating the frames with the silk stencils. Another type used has hinges placed at one end of the frame, and the frames are raised by having a pulley attachment to the wall over which a small rope operates with one end attached to the frame while the other has a small weight. The weight raises the stencil frame after the sign has been lettered and while it is being removed for the insertion of another one.

In some cases the frames are made larger than is necessary for the signs to be lettered, and various sizes of signs are used with the same frame by tacking ½-in. strips on top of the bench to serve as guides holding the signs in position. Some sort of accurate support is quite essential in order to make the stencil register accurately with the sign to be lettered.

The paint used for lettering is forced through the silk screen by means of a squeegee, and an accompanying illustration shows the construction of such a squee-

Lettering a Long Routing and Destination Sign by the Silk Screen Process

gee which has proved satisfactory. This consists of a sheet of rubber about $\frac{1}{8}$ in. thick clamped between two blocks, with a spacing block at the top. A medium grade of hard rubber is best. This should be cut into a strip about $4\frac{1}{2}$ in. wide, and for single signs it should be a little longer than the width of the design to be lettered. For signs having a large amount of lettering, a squeegee about 12 in. long will be found to be of convenient length and about as long as can be handled readily. In placing the rubber between the boards, it should be allowed to extend about 2 in. outside. The side pieces can best be held in place by two bolts. This method of construction permits of removing the rubber when worn down or for trimming off or sharpening. The edges of the rubber should be beveled and the extended edge made sharp, as it is this edge that is drawn over the side of the frame so as to force the paint through the screen. Careful cutting is quite essential in order to provide an efficient squeegee.

For white letters, white lead mixed with turpentine and oil is generally used. A small quantity of this is placed along the edge of the frame farthest from the operator. By drawing the squeegee across the screen the paint is forced through onto the sign and so letters it. After drawing the squeegee across the frame in one direction, it is usually found most convenient to draw it in the opposite direction for the next operation, as this makes it unnecessary to scoop up the paint from one end and place it on the other end.

After finishing a job the stencil should be well cleaned. All surplus paint can be removed by a stiff card, and by pouring a small quantity of kerosene or gasoline into the stencil the paint in the screen can be removed by rubbing with a soft cloth. The operation should be repeated until the cleaning is satisfactory, when both sides should be dried carefully. Some roads find that a mixture of equal parts of kerosene and gasoline makes a good cleaning preparation.

USING LARGE FRAMES FOR CURTAIN SIGNS

The New York Rapid Transit Corporation uses the silk screen process for lettering its routing and destination signs, which have thirty-one readings on a single sheet. These sheets are lettered on both sides, using 3-in. letters with a 3-in. space on one side and 4-in. letters with a corresponding space on the opposite side. For lettering one of these complete signs, three frames with silk stencils are used. These frames are 26 in. wide by approximately 6 ft. long. Black linen is used as the material for these signs and the lettering is of white lead. The linen is laid on a long table and the lettering is done by beginning at one end and proceeding progressively. One frame is placed in position at a time and the edges of the table are marked so as to insure that the frames register properly with the sign. After the signs are lettered, they are dried by placing on drying racks, which consist of pipe extensions from the wall, so arranged that the signs can be supported on these to insure no interference while drying.

The silk screen process has proved to be very suc-

cessful for special designs and illustrations, such as are used in publicity campaigns. The particular advantage in using this rather than an engraving or lithographing process lies in the low cost where small quantities are needed. For doing work of this nature it is necessary to prepare a sensitized screen. The original design or lettered copy is traced in black on a transparent surface, such as glass, celluloid, tracing cloth or tracing paper. The cloth is stretched over its supporting frame and after being cleansed the sensitized solution is poured on at one side, so as to cover the mesh entirely. By having the screen at an angle, the solution gradually flows over the surface. This photographic negative is placed with the printing side down on the screen and a heavy piece of glass is placed over this. Then by holding the screen in close contact with the negative, it can be printed the same as in regular photography, by exposing to the sunlight for about twenty minutes. The screen is then washed out by flowing water over both sides. The portion that is protected from the sun's rays will wash out completely, leaving the sun-fixed portions which are insoluble. The printing is then carried on in the same manner as already described.

Where multi-colored reproductions are desired, a separate screen for each color will be needed. The different frames should be prepared of exactly the same size, so as to insure perfect register, and the tracings are prepared by sketching in each color separately on the different screens.

Concrete Cuts Paving Costs*

THE use of concrete for paving between the rails, regardless of the type of pavement used on the rest of the street, has saved the Northern Texas Traction Company, Fort Worth, 50 per cent of the first cost of the work and has at the same time reduced the amount of upkeep required. The franchise of this company states that the railway shall pave between its tracks with the same kind of pavement as is used elsewhere on the street. In the past this practice has resulted in a large amount of unsatisfactory paving being placed between the rails. Moreover, the maintenance of this

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

This Concrete Paving Between the Rails in Fort Worth Cost Only Half as Much as the Paving Elsewhere on the Street

unsatisfactory paving has been very costly. In reconstructing some track recently, preparatory to paving the street, the company sought permission from the city to place concrete paving between the rails, and in spite of objections from the paving contractor permission to do so was granted.

The cost of the paving which the contractor intended to lay would have been about \$2 per square yard. Experience has shown that the maintenance cost of this type of paving after it was laid was high. The company therefore told the city officials that it was tired

of paying out large sums for the first cost of such paving and later for its upkeep, and promised to lay a better paving of its own between the rails at a cost of only \$1 per square yard, with practically no maintenance after the job was finished.

The first step in laying the railway's pavement consisted in bringing up the concrete to within $\frac{1}{4}$ in. of the top of the rail. About 2 in. below the surface the concrete was reinforced by wire net reinforcing. After the concrete had firmly set the surface was given a coating of tar and chat as a finish. It is predicted by the company that this paving will outlast by several years the bitulithic paving used on the rest of the street.

Track Relaid Amid Heaviest Vehicular Traffic

The Original Rails Laid in 1898 on Broadway, New York City, Were Replaced Under Conditions of Unusual Difficulty

A COMBINATION of circumstances made particularly difficult the job recently done by the Third Avenue Railway, New York, in renewing the rails on Broadway from Forty-fifth Street to Fifty-ninth Street. This area includes the Longacre Square theater district, which is reputed to have the heaviest vehicular traffic in the world. In spite of this fact the work had to be done during the daytime because there are a large number of hotels in this vicinity and they would not tolerate the noise of track reconstruction work at night. A headway shorter than two minutes is operated on Broadway and it was necessary to remove each rail and replace it by a new rail in the interval between cars. With the underground conduit type of construction in use there it was not feasible to switch cars onto another track while this work was in progress.

Another difficulty arose from the nature of the original construction work. The old rail was that laid in 1898, when the first electric car line on upper Broadway was electrified. The foundation was continuous between the yokes and was built with an extremely rich concrete mixture. Considerable difficulty in making even minor repairs had been caused by the solid nature of this foundation. This was one of the factors, however, which made it possible to

postpone renewal work and to continue the use of the old rail until a short time ago.

The work done on the present job consisted of removal and replacement of the paving, excavation of a sufficient depth of the old concrete to permit removal of the old rails and the longitudinal timber stringers on which they are supported, in case it was necessary, and the renewal of the track rails.

Knowing the difficulty of the job it was undertaking and the necessity of getting through as speedily as possible the railway assembled an unusual amount of apparatus. A specially mounted new air compressor, built by the Chicago Pneumatic Tool Company and having a capacity of 350 cu.ft. per minute, was used for the first time. In addition to this there was also an older compressor, having a capacity of 150 cu.ft. This made possible the simultaneous operation of nine compressed air drills, six on the large machine and three on the small one.

The southbound track was relaid first and then the northbound. Only two blocks were open at one time. While the excavation of one block was in progress, new 9-in. grooved girder rail was being put down in the block behind. This in itself was no small task with the short headway on the route, but service was not interrupted for longer than a few minutes on account of the track reconstruction. As soon as the new rail was laid the excavation was concreted ready for the asphalt pavement, or else temporarily filled in so that traffic could pass.

In many cases the digging had to go down to depth of 16 in. or more. This was necessary in order to cut free from the concrete the timber supports which run lengthwise under the rails. It was found that where "dutchmen" had been put in at the joints the supporting timbers usually were cut up. The amount of timber replacement averaged about 3 ft. for each 60 ft. of rail put in. The slot rail was not renewed.

This was the first job on which the 350-cu.ft. capac-

A 350-Cu.Ft. Compressor Was Employed to Expedite Track Reconstruction Work on Upper Broadway, New York

ity air compressor was used and it proved to expedite the construction greatly. The new machine proved to be very reliable and operated continuously for many hours each day without a single shutdown. Under ordinary circumstances a machine of this capacity would hardly be needed, but where an asphalt pavement had to be taken up and a solid concrete foundation excavated the greatest possible number of pneumatic drills was necessary. By the use of the new machine, together with the older one already mentioned, and a large gang of experienced track men, it was possible to complete the job of 3,500 ft. of double track in seven weeks.

The Readers' Forum

Insurance Men Want to Help Reduce Premiums

WESTERN ACTUARIAL BUREAU

CHICAGO, ILL., Dec. 7, 1923.

To the Editors:

Your editorial on fire prevention in the issue of Dec. 1 was more than of passing interest, in that you have hit upon the key to lower insurance costs to street railway companies.

You may remember from the articles which appeared in your paper, some time since, covering the East St. Louis & Suburban Railway and the Tennessee Electric Power Company, that quite a material saving in fire insurance premiums may be enjoyed through proper attention to even ordinary fire protective precautions.

That the fire insurance companies are willing to co-operate in this work is evidenced by the fact that in many insurance jurisdictions special men or separate departments are maintained to handle just the electrical properties.

Keep up the good work. We are with you in any effort put forth to help in the fire prevention work on street railway properties. JAMES S. MAHAN.

Further Suggestion on Reducing Number of Car Parts

DEPARTMENT OF COMMERCE
OFFICE OF THE SECRETARY

WASHINGTON, D. C., Dec. 5, 1923.

To the Editors:

Your idea of approaching the storekeepers in promoting simplification of car parts is a splendid one. They ought to know what excessive diversity means in increased inventory, increased investment, increased carrying charges, greater depreciation and obsolescence, as well as extra space required, and the ever-present difficulty of always having on hand plenty of what they don't want and never enough of what they do want.

One major advantage of simplified practice is that it can be applied by purchaser as well as by manufacturer. Why should an electric railway company carry in its stores ten, or even five, different varieties of the same thing if their requirement can be amply covered with one or two? The steam roads have been doing some effective simplification of stocks recently, and in the past two and a half years forty of the large roads have reduced their total stores investment from \$480,000,000 to \$300,000,000, or 37½ per cent. At the same time, they have cut their stocks on hand from six months' to three months' supply, and find that they can give good service on that minimum through the better co-ordination of purchasing and delivery schedules.

In the automotive field we know of a certain large garage company which, by simplifying its equipment to one make of motor trucks and one make of passenger cars, reduced spare parts stock from 20,000 to 5,000 items, reduced varieties of tires, oils, greases, etc., decreased stockroom space, personnel and investment; also secured better prices in purchasing, and reduced costs (not including pay of drivers) 2 cents per mile

in 1922 over 1921 and 5 cents per mile in 1922 over 1920.

Isn't there something in these examples for the electric railway companies? If, coincident with their efforts to induce more people to ride, they applied simplified practice, i.e., the elimination of superfluous varieties, to their purchases, etc., wouldn't the combination prove a paying one?

Simplified practice means the reduction of variety in sizes, dimensions and immaterial differences of everyday commodities as a means of eliminating waste, decreasing costs, increasing profits and values in production, distribution and consumption. It is not standardization! Instead, it is often the forerunner of standardization, for by eliminating unnecessary varieties the way is cleared for that concentration on the varieties remaining which permits the development of standards that are real standards. Simplified practice is a measure which can be applied with immediate benefit and with accruing advantage during the usual long evolutionary period required in producing a standard.

The survey you propose to make will, we believe, bear out these statements. We will be eager to hear your findings and conclusions. If we can be of further help to you, let us know. Meantime, the best of success to you. You have started a well worth while movement, and we are very confident many of the companies will warmly respond to your suggestion as to how they may apply simplified practice to advantage in their big problem of lowering operating ratios.

DIVISION OF SIMPLIFIED PRACTICE,

BY R. M. HUDSON.

Large Letters on Dash Sign Distinguish Routes*

CARS which operate on different lines of the El Paso Electric Railway and running in part over the same streets are equipped with special car destination signs, 16x24 in. on the dash, in addition to the regular illuminated sign carried on the hood. These signs are differently colored for the different lines, and the line is designated by a large letter such as P for Park and V for Val Verde, as shown in the illustration.

Equipment Maintenance Notes

Board Shows Progress of Car Overhauling

THE accompanying illustration shows a progress board which is installed in the office of the superintendent of rapid transit shops of the New York Rapid Transit Corporation at Thirty-ninth Street, Brooklyn. This is arranged to show

work to be done, such as stripped, gates removed, seats inspected, hand straps inspected, floor repaired, doors inspected, foundation brake rigging overhauled, shields over-resistance repaired, etc.

The board is divided into two parts the upper section being used for elevated cars and the lower section for subway cars. Each class of

places the car number at the top of the board, and as soon as the particular class of work is finished the foreman puts a peg in the proper location to indicate that the work is completed. The progress of the work can thus be seen at a glance not only by the superintendent of rapid transit shops and his assistants but by each individual foreman. They can thus see what class of work is behind and bring proper pressure on those responsible so that the work will be turned out promptly. The working of the board is entirely automatic, as each foreman places the pegs in position, and at the same time looks over the record of work so as to see which cars are ready for his men. The board has also proved an incentive to each foreman to keep a record of the work in a small notebook. Previous to the use of this the general superintendent had particular difficulty in having each individual foreman keep a record of the dates that work was done on various cars, but with the use of this board the foremen place a record in their notebooks so that they can peg up their work each morning, in order to show its progress. When the work on a car is completed and leaves the shop the clerk removes the pegs from the column under the car number and removes the car number.

A Distinctive Colored Peg Designates Each Class of Work in Overhauling Cars

the progress made in overhauling cars by the different departments through the use of pegs which are placed in holes on the board. The board is about 4 ft. x 4 ft. in dimensions and has the various holes arranged in rows and columns. Car numbers are placed at the top of the board and opposite each row at the side is a designation of the type of

work is designated by a different colored peg—blue is used for wiremen, yellow for painters, green for the truck department, white for pipe fitters, red for riggers, light blue for machinists and black for the carpenters. Seven pockets are provided at the bottom of the board for holding the pegs. When a car is received in the overhauling shop the clerk

Wooden Journal Box for Skidding Truck

AFTER a truck has been dismantled it is often necessary to move the frame about the shop for repairs. This of course can be accomplished by means of an overhead crane. However, "skidding" a truck around on pairs of wheels is an easy method. As this requires the replacing of the four journal boxes and brasses it is looked upon as rather an arduous task. A device worked up in the shops of the Metropolitan West Side Elevated Railway, Chicago, facilitates this work by eliminating the placing of the journal boxes and brasses.

A pine wood block, cut to fit the pedestal jaws, of such height that the center of the axle will be in its nor-

mal position, is used. The truck is lifted, a pair of wheels rolled under and these wood blocks inserted in place of the journal boxes. With grease on the bearing end of the box, a truck may be skidded about with ease. As a safeguard against

Wood Block Used in Place of Journal Box, for Mounting Truck on Axle, to Skid Truck About Shop

the block sliding out of position, a groove is cut in the upper end $3\frac{1}{2}$ in. wide and 1 in. deep to receive the truck frame member. The block itself measures 12 in. long, 10 in. wide and 5 in. thick, and besides having the groove to receive the truck frame at the one end, it has a semi-cylindrical groove at the other end to receive the axle bearing.

Building Up Worn Armature Housings

CONSIDERABLE wear occurs between the bearing surface of armature housings and the frames of split-frame motors. A method of re-

Method of Building Up Worn Armature Housing and Section of Cold Rolled Steel Ring Used

newing the wearing surface of housings is used at the West Shops of the Chicago Surface Lines which is very simple and can be carried out

without much cost. An accompanying illustration shows the method. The worn head is turned up with a V-shaped groove and a ring of cold rolled bar stock is fitted into this. The section of the groove and the shape of the ring used are shown in the accompanying drawing. The ring is formed of ordinary steel plate with an opening so that it can be sprung into place on the armature housing, and, of course, it is held firmly in place by the two halves of the motor shells when these are fastened together. By this arrangement repairs are carried out at small expense. Drilling for screws is unnecessary and the adding of metal by welding also is not required. When the ring becomes worn it can be removed and readily replaced.

Weed Whipper Reduces Danger of Accidents*

ONE of the problems of the track department of the Northern Texas Traction Company, Fort

holes 2 in. apart, through which 24-in. sections of steel cable are thrust. The latter are held in place by seven screws. With this equipment it is possible to cut an average of twelve miles of grassy track per day. Its use has made it possible to keep a neat appearing right-of-way and at the same time to reduce the accident hazards by keeping the grass off the rails.

Keeping Waste Under Journals

A COMMON type of journal box cover is held in place by a single bolt at the top, about which it rotates, while a spring between the top of the cover and the bolt gives the required tension to hold the cover in position. Trouble is frequently experienced by the waste in the journal box working forward and forcing the cover out of position. This allows the waste to hang outside the lower part of the journal box and oil is thus fed out of the

Steel Cable Sections Fastened to a Rotating Shaft Cut Weeds from Between the Rails

Worth, is to keep the grass cut below the level of the rails on inter-urban lines. This is particularly important because grass on the rails makes it difficult to stop cars in an emergency. To accomplish this without a great deal of waste of time and labor, the company has built a single-truck service car with an end cab, equipped with a stationary motor on the deck. This motor drives a shaft suspended just above the rails and in front of the truck. The shaft, which is of 3-in. diameter, is bored with one-half inch staggered

box leaving the rear end empty. This results in hot bearings.

The accompanying illustration shows a bent sheet-iron plate attachment to fit inside the journal box cover and hold the waste in position under the journal. This design was originated by H. C. Mason, lubricating engineer for the Texas Oil Company. A shelf or lip is provided on the bent plate attachment which projects inward toward the axle. When in place the working of the waste forward under this shelf holds the cover more firmly in position, and with the journal properly packed this shelf will press on the waste and hold it under the journal, and the

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

waste cannot get out or change its position. It is also impossible for the cover to change its position to any extent, as the attachment comes in contact with the housing and prevents it.

In the usual maintenance of waste in bearings it is quite common prac-

medium for conveying oil to the surface of the journal to be lubricated. Also, if proper care is not exercised the waste may be pressed so hard that the oil will run out the back end and on to the wheel, so as to cause the housing to overflow. By using this attachment it is unnecessary to press back waste at such frequent intervals, so that there is a considerable saving in labor and a reduction in the amount of oil wasted. The device is a good insurance against hot journals.

Bent Plate Attachment to Journal Box Cover for Retaining Waste in Place Under Journal

tice to force the waste in place up against the journal, at frequent intervals by a packing iron as the waste works forward. Every time that the oiler uses the packing iron it cuts some of the threads of the waste, which decreases its value as a

Lighting the Fare Box on One-Man Cars*

SINCE the development of the one-man car, the necessity of some better kind of illumination near the fare box for the convenience of the operator, so that he could more readily punch transfers and make change, has been realized by railroads. Also, with the ordinary lighting, it is sometimes difficult to see whether or not the proper fare has been deposited in the box. The El Paso Electric Railway has equipped one car with a lighting unit as shown in the accompanying illustration. A

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

Adequate Light Is Directed to the Fare Box by Means of This Unit

conduit of the VD-33 type was installed on the fare box stanchion, making a shade to cover the light globe and cutting an inverted V on the edge of the shade so that the light would reflect into the fare box. The operators were so well pleased that this device is now being used on all of the company's one-man cars.

A Ray of Light Strikes the G. M.

AN air of gloom pervaded the machine shop of the Jinxville Railway on this December morning. There was no sensing of the Christmas cheeriness on this day. The rain was beating down outside and Ole Olsen, Dick Singer and the rest were trying to do their work with the aid of a few dingy carbon-filament incandescent lamps, which hung by long cords from the ceiling. It was enough to give anybody the blues. Even Singer, usually referred to as "Whistlin' Dick," was glum.

Into this depressing atmosphere William Redfield, the general manager, brought a visitor, a lawyer from West Virginia.

"Hello, what's this dark hole?" asked the visitor, as they stepped in.

"Machine shop, Sam," replied Redfield; "it is a bit forbidding, but it's a dark, wet December day outside; you can't expect much brilliance on a day like this."

"I suppose not, William; not being a railroad man I don't feel like criticizing. I'm a lawyer, though, and handle a lot of accident cases. I'll bet it would cost you a pile of money

William Redfield, general manager of the Jinxville Railway, gets a tip from a lawyer friend from the South. Decides a few things can be done to brighten up his machine shop with a view to the comfort and safety of the men and improvement in the work.

if one of your men got hurt from not being able to see clearly.

"Our men don't complain, Sam; but now that you've called my attention to it the place does look mighty dark."

"I'll say it does, Bill. I don't see how you expect to turn out good repair work in a shop like this. Seeing your shop reminds me, by contrast, of one down where I live, in Huntington. Say, old man, that's one of the most cheerful places you can imagine. Our little railway is a crackerjack, anyway; but the shop is one of the best parts of the outfit.

You ought to have a look at it. The walls are all coated—some kind of a shiny paint—and the windows are big enough to let in some light. Then for dark days they've got some worthwhile lamps. Of course, you'll say I'm always boostin' Huntington. Well, it's worth it. If I didn't know you so well and what you've done in a little over a year to rejuvenate this run-down property I wouldn't say anything. I know you won't take this amiss. No charge for the advice either. I usually collect about \$25 for a suggestion like that."

"No harm done, Sam, and maybe some good. You've opened my eyes a bit. I see several things we could do here for a little money. We could get some good paint on the walls; we could hang some decent fixtures and lamps; we could put in two or three skylights, and we could clean our windows. Bill Jones, our foreman here, is a good fellow but kind of slack. I'll put him wise to this matter and I think the men will appreciate it. Let's go over to the paint shop. It's more cheerful over there."

New Equipment Available

New Type Riveting Hammer

THE Ingersoll-Rand Company, New York, N. Y., has developed a new type of pneumatic riveting hammer with many added improvements. The outstanding features of this new riveter include bolted construction for holding the handle to the barrel, heavy section valve with liberal bearing surfaces, combination poppet and piston type throttle valve, power in excess of ordinary requirements, low air consumption and easy operation.

The new hammers are manufactured in three styles, A, B and C,

Rivet Hammer with Features for Easy Handling

and are available in a complete range of sizes from a 5-in. to a 9-in. stroke. Each size of this riveter can be purchased with any one of three types of barrels and with either outside or inside trigger handles.

The standard "A" type has a barrel machined to accommodate a rivet set clip only; three alloy steel bolts, fitted with lock washers, hold the handle to the barrel. This enables the hammer to be taken apart anywhere for inspection or cleaning with the aid of only a wrench; no vise, crowbar or other tools are necessary.

The throttle valve, except on inside trigger handles, is a combination of the piston and poppet types, having the control of the piston valve and the freedom from leakage of the poppet type. The beveled seat will remain tight and prevent leakage. The throttle lever or trigger is made in one piece from special heat-treated spring steel and has a long bearing in the handle, making it capable of withstanding abuse. The control is sensitive, ranging from a light tap to a heavy blow, entirely at the will of the operator.

The valve is a sleeve made from special alloy steel. It has liberal bearing surfaces and its walls are free from holes or ports which so often are the starting points for

checks or cracks. It operates in a valve box of strong construction, located in the head of the barrel. The valve box is constructed with a solid end which enables it to be easily taken apart by the use of a piston for the removal of the valve, without recourse to the use of a screw-driver or similar instrument. This construction also insures a compression chamber in the valve box which cushions the piston on the return stroke and prevents the piston from striking the handle.

The handles are of high quality steel, drop-forged to a shape that fits the hand and are sand blast finished to give an excellent grip. Either outside or inside trigger handles can be furnished, although the outside type is standard. The exhaust is through the side of the barrel near the handle and can be deflected in any direction desired by the operator, by merely turning the deflector.

Due primarily to the bolted handle construction, the hammers are lighter in the handle end and are better balanced and easier holding, especially when used in a horizontal or inverted position.

Boring Machine with Motor Armature on Spindle

A SINGLE-SPINDLE borer with several new features is being placed on the market by the Oliver Machinery Company, Grand Rapids, Mich. This machine has been given the name of "Motor-in-Head Vertical Borer" because the rotor of the motor is mounted directly on the spindle of the boring machine. This eliminates all belting, countershafts, pulleys and a number of bearings. It also saves floor space and makes a simpler machine. Another interesting feature of this machine is the blower, which is also mounted directly on the spindle at the top of the machine. This blows the dust or borings away from the work.

This machine has a capacity for boring holes up to 2 in. diameter and up to 6 in. depth with one stroke. The distance from the center of the spindle to the column is 18 in. and the vertical movement of the table 14 in. The maximum stroke of the motor head is 6½ in. The table

swivels completely around and tilts up to an angle of 45 deg. in any direction. The column is a one piece casting, with a wide flange base, measuring 24 in. by 31 in. A counterbalancing weight is provided inside the main vertical portion of the column, which also forms the connecting link between the foot lever and the head lever. A hood cast integral with the column deflects chips away from the foot lever. The motor is fully inclosed and the housing consists of two halves clamped together by large bolts. The motor's stator is clamped concentrically inside of these two halves with an air passage for ventilation. The rotor, together with the spindle, is provided with ball bearings at the outer ends. The lower half of the motor head has a lug at the back through which a connecting link and a counterbalance

Single-Spindle Boring Machine

lever system reaching to the foot lever supplies the downward motion of the head. A coil compression spring provides the necessary return movement.

A funnel type pressure blast fan is mounted at the upper end of the motor head. The blades are one-piece aluminum castings pinned to the upper end of the boring spindle. The air blast is directed downward toward the boring point, so as to blow the chips away and cool the boring bits.

Association News & Discussions

Way Problems Occupy New England Club

Progress in Methods of Snow Removal, Systematized Methods of Track Repair and Electric Freight Opportunities Discussed at Boston Meeting—Machinery Playing Larger Part in Way Maintenance

THE advance of machine methods into the field of way maintenance featured a well-attended meeting of the New England Street Railway Club at the Copley Plaza Hotel, Boston, Dec. 6, President Ralph D. Hood occupying the chair. A number of addresses were given on the subjects of snow removal, trackwork and inter-urban freight. Following the usual dinner, Chief Photographer Jones of the Boston & Maine Railroad gave an illustrated lecture on the "Scenic Attractions of Maine."

In an early issue an extended account of the Eastern Massachusetts Street Railway Company's planning and control of way maintenance will be published by courtesy of R. B. Stearns, vice-president, and F. B. Walker, enlarging upon the material presented at this meeting in a paper by Mr. Walker on the subject "Track Machinery."

SNOW REMOVAL BY MACHINE METHODS

C. F. Reuter, engineer Eastern Tractor Company, Cambridge, Mass., pointed out in his talk on "Snow Removal" that the demand for snow removal has attained such proportions that this year an effort will be made by the Massachusetts Department of Public Works to keep open a number of the major trunk line highways, although not as much work will be done as though the proposed tax on gasoline had passed the last Legislature. Monopolization of street railway tracks by highway traffic is to be done away with on these trunk lines. It is proposed to try out the use of buses equipped with a form of plowing apparatus on some branch highways, but this, in the speaker's opinion, will be chiefly experimental.

The tractor, with its concentrated large power, appears to offer the best solution of the snow-removal problem, declared the speaker. It has been successful in Dakota, Montana, Michigan, New York, New Hampshire and other states. Despite the high power present in the modern tractor, a representative unit described by Mr. Reuter has a bearing weight of only 4 lb. per square inch upon the highway and does no damage to the road. Drifts 8 to 10 ft. deep can be handled with ease. A plow with a 10-ft. blade run by a 5-ton truck will remove

40,000 sq.ft. per hour as compared with 70,000 sq.ft. by tractor. The tractor costs less to operate than the truck and the average expense of "bucking" snow with a tractor of from 5 to 10 tons rating is about 92.4 cents per mile of route cleared.

The latest development in snow-handling equipment, the speaker stated, is the rotary plow-tractor combination. A 5-ton tractor unit is equipped with a 60-hp. gasoline engine, driving a rotor plow at 1,000 r.p.m. Two inverted V-blades lead to an opening with an area of 4½ sq.ft. at the throat of the plow, the scooped in snow being drawn through the rotary blades and thrown to one side for disposal. The machine adjustments permit throwing the snow 100 ft. off-side, or the outfit can be designed to deposit the snow in a gondola car behind the tractor. If desired, the snow can be thrown off at intermediate distances. Loading into another vehicle continues while the plow and tractor are moving with traffic at a speed of from 1 to 6 m.p.h. The snow is pulverized finely so that a 5-ton truck will carry away about 4 tons of dry snow instead of 1 tons of loose, lumpy snow.

A new plow to be used by the Boston Elevated Railway will carry rotor blades of 2-in. x 18-in. x 36-in. chrome-nickel steel. The rotary end costs about \$6,000. A 5-ton Holt tractor with auxiliary equipment costs about \$4,750, or a Best tractor, including cab, heating coil, radiator and complete lighting outfit, \$4,250.

In clearing the Champs de Mars, Montreal, Canada, of snow the job was done by tractor for \$25, whereas an appropriation of several thousand dollars had been thought necessary for hand shoveling. This field was 1,000 ft. long, 125 ft. wide and had snow on it 18 in. thick. The rotor runs in ball bearings and will turn four minutes after receiving an impulse by hand. The latest rotor has four blades, which means 4,000 cuttings per minute. The cutter can be dropped from 8 in. above the rail to the rail top. The intake blades are lined with 8-in. metal reinforcement and can be reversed after wear. The minimum width of the machine is about 6 ft. 9 in. to 7 ft. The overhang over curves covers about 5 ft. of street width. Estimated yearly depreciation of the tractor is 12½ per cent,

and repairs 6½ per cent, of the first cost. The engine is the only part which is likely to give trouble.

EXPERIENCE WITH ROTARY SNOW BROOMS IN GREATER NEW YORK

W. B. Kelley, head of the division of operation and maintenance, Department of Plant and Structures, city of New York, described the failures of old-style sweepers and plows on Staten Island, N. Y., during heavy storms three years ago. Grades on this system run from 6.5 to 10 per cent maximum, curvature reaches 28 to 33 deg. and there are many hills and valleys, with great exposure. In 1921 the trackless trolley system was installed and in the fall of that year a Fox rotary snow broom was tried out by the city. Twenty-six snowstorms with a minimum of 6½ in. of snow were overcome without tying up traffic, and in one case 56 miles of track were cleared in 3½ hours, when all other sweepers had failed. "I tried every known mechanical stunt to make the outfit fail," said Mr. Kelley, "but the machine merely laughed at me and came up for more punishment!" The Staten Island lines were operated when all other surface lines in New York were tied up. The Fox outfit is run in summer as an emergency truck and tower. The broom will remove more snow from a paved street than any two sweepers. A nine-track terminal with two automobile thoroughfares was cleared in 43 minutes compared with hours' work by 200 to 300 men in older days.

Mr. Kelley said that the broom can be removed in 25 minutes. Rattan is used instead of steel for the brushes. Only three sets of brooms had to be purchased in the twenty-six storms. The railway has gone through 7 ft. of snow with this broom and the Public Service Commission of New York highly praised the road's efforts to keep open during the past winter. The outfit can be mounted on a chassis and removed in about an hour. The New York Street Cleaning Department now has fifty-six of these brooms; the trackless trolley system has two and four more on order. There is a 24-ft. roadway on the trackless trolley system and the trolley runs from side to side like a bus. About 26 miles comprise the trackless trolley system. The broom operates when going up grades, as it has a separate engine drive, and this is not the case with an electric sweeper. Four or five of these outfits went a long way toward keeping the International Railway lines in Buffalo open during severe winter weather. The Department of Plant and Structures of New York proposes to purchase ten

more rotary brooms for use on the trackless trolley lines. All the Staten Island sweepers were to be sold last week.

INTERURBANS MAKING PROGRESS IN FREIGHT HAULAGE

That remarkable progress has been made in the business of handling freight on interurban lines was the conclusion of T. H. Stoffel, Westinghouse Electric & Manufacturing Company. This has taken place particularly in the Central West and even there only the surface of possibilities has been scratched. Data have been gathered, he said, which indicate that approximately \$50,000,000 will be received by electric lines for handling freight and express for the years 1923, and that a total of more than 1,000,000,000 ton-miles will have been handled

quarters of the total received at those yards. The indications are that they will do much better during the current year, as stock raising has been taken up by many farmers who formerly thought that the effort was not warranted by results. Another line handled 2,500 carloads of cement up to Nov. 1 this year, and has contracted to move more than 3,500 cars during 1924. These cases are cited merely to indicate the extent to which freight business has been developed in the Central West.

What is probably of the greatest importance is that the lines in the territory referred to are showing a net profit in their freight operation of from 15 to 35 per cent on the investment in freight facilities and equipment. This balance appears after deducting from freight income all expense directly

nage, and this tonnage, particularly less than carload merchandise, is less profitable for them. As a result, some of the large trunk lines are giving serious consideration to ways and means of relieving themselves of the burden of transporting such tonnage of congested terminals for destinations 100 to 150 miles distant, thus relieving both terminals and rolling stock for use in the more remunerative and desirable long-haul traffic. One of the main trunk lines is also experimenting with the motor truck to relieve terminal congestion, while other roads are asking shippers at large terminals to consider shipping via electric lines where available, or to use established motor truck lines.

Experience has demonstrated, concluded Mr. Stoffel, that it is not impracticable or unreasonable to super-

Rotary Snow Broom of Type Used by Department of Plant and Structures on Staten Island Lines in New York

before the end of the year; that electric lines now have in regular freight service more than 13,000 freight and express cars, and more than 475 electric locomotives are employed.

The fourteen or fifteen electric lines, operating over 4,000 miles of track in the Central States, are not confining their efforts to the handling of merchandise or less than carload freight, but in the past two years have consistently broadened their field and are gradually adding facilities permitting them to move all classes of tonnage, including carload consignments of live stock, cement, stone, building material, coal, lumber, logs, canned goods, etc., at rates which are competitive with those in effect on steam lines.

As a result, these lines are finding it difficult to take care of the demands made upon them, through lack of rolling stock and adequate terminals. Shipments are handled over this group of lines for distances up to 350 miles or more, and the service rendered is from forty-eight hours to eight or ten days better than can be secured through any other means of transportation.

The lines centering in Indianapolis handled more than 8,000 carloads of live stock into the Indianapolis stock yards in 1922, which was three-

chargeable to freight operation, and in addition an equitable proportion of the cost of maintenance of roadway, track, distribution system, power plant, administration, taxes, etc.

Possibilities of conducting a remunerative freight business in the New England district are as good as if not better than in the Western territory, according to the speaker. New England is primarily an industrial section of the country, and there is hardly a town that does not produce tonnage, and of the class which can readily be handled with interurban equipment. It is realized that some of the lines in the New England district are carrying freight, but it is obvious that full advantage is not being taken of the possibilities.

While the motor truck is becoming an exceedingly important factor in the transportation of the country, it is handling tonnage every day which should be better and more economically moved by electric lines, and at much less cost to the public. Steam carriers are also beginning to realize that their equipment and facilities, which were necessarily designed and constructed for the movement of long hauls and heavy, bulky tonnage are not suitable for the economical handling of the comparatively short-haul ton-

impose the operation of freight on the passenger service rendered by electric lines. Much of the road work can be done at night, or during off-peak hours when the power demand is low, and therefore no additions are necessary to power generating and distributing equipment. Practically the only added expense attached to the transportation of freight is to provide motive power, rolling stock, terminals and a competent and experienced traffic department, the cost of which is comparatively small. The net returns invariably more than warrant the effort.

A.I.E.E. Midwinter Convention

TWO sessions will be devoted to national transportation problems at the midwinter convention of the American Institute of Electrical Engineers, to be held at Philadelphia Feb. 4 to 8. These will be held at the Metropolitan Opera House the afternoon and evening of Feb. 5. Among the speakers will be Ralph Budd, president Great Northern Railway; N. D. Maher, president Norfolk & Western Railway; C. H. Markham, president Illinois Central Railroad; Edward G. Buckland, vice-president New York, New Haven & Hartford Railroad; and L. G. Coleman, assistant general manager Boston &

Maine Railroad. Other speakers will be announced later.

A wide range of subjects will be discussed at the convention, including such topics as the superpower system and other transmission subjects, power-

plant operation, insulation, generator design, radio telephony, and miscellaneous subjects. Monday evening will be devoted to a celebration of the fortieth anniversary of the founding of the Institute.

Proposed Motor Vehicle Statute

At Convention of Utility Commissioners, Committee on Motor Vehicle Transportation Recommends Regulatory Law and Sets Forth Its Advantages

AT THE annual meeting in Miami, Fla., last week of the National Association of Railway & Utility Commissioners, the committee on motor vehicle transportation suggested a "model motor vehicle statute." It is based somewhat on the present regulation in the State of Washington, and the report was presented by E. V. Kuykendall, chairman of the committee and director of the Department of Public Works, Washington. According to this law all companies and individuals engaged in auto transportation would be divided into two classes, namely, Class A, embracing all supplying auto transportation between fixed termini over a regular route, and class B, those not operating between fixed termini or over a regular route.

Class A companies are required to take out a certificate of convenience and necessity, file quarterly reports with the commission and pay a fee, not to exceed 1 per cent of their gross revenue, to cover the cost of supervision and regulation.

Class B operators are those which in the past have usually escaped regulation, but are now forbidden to operate for the transportation of persons or property for compensation without having obtained a permit from the commission to do so. For such permit they will pay an annual fee of \$10 for the vehicle, a fee of 50 cents per passenger seat, provided that the passenger seating capacity exceeds eight, and \$2 per ton for weights over 3 tons.

The commission has power to supervise and regulate all such companies, whether in class A or class B, to fix, alter and amend just, fair, reasonable and sufficient rates, various charges and classifications, require the filing of reports, describe rules and regulations for their service.

The law declares that an occasional accommodative transportation service by a person not in the transportation business shall not be construed as a service for compensation. Operation within a city or town, school buses and vehicles engaged exclusively in hauling farm products are also excluded.

REASONS FOR STATUTE

In explanation and support of this bill the report, said in part:

We realize that there are a number of states in which motor vehicle regulation is administered under general statutes authorizing regulation of the

rates, service, and facilities of common carriers, but there are so many peculiar phases of motor vehicle regulation which are inapplicable to other modes of transportation that better results can be obtained through special statutes covering that subject alone.

The first question which would probably suggest itself is: Why divide auto transportation companies into two classes? The original auto transportation acts in several states undertook the regulation of companies operating between fixed termini or over a regular route only. Practical experience has disclosed that freight trucks and for-hire passenger cars, maintaining stands in the various cities and towns, are operating over the routes covered by the certificates of convenience and necessity issued to the auto transportation companies and are keenly competitive therewith. These independent operators do not come within the purview of most of the regulatory acts, for the reason that they do not operate between fixed termini or over regular routes. They escape all regulation. They are not put to the expense of fees nor the furnishing of bonds required of regulated concerns to protect the public against negligent operation. They frequently engage in cutthroat competition with each other and with certificate holders to their own detriment and to the injury of regular certified operators and ultimately to the detriment of public service. All auto transportation companies transporting passengers and/or property for compensation would be embraced either under one of the two classes mentioned in the act.

The proposed act does not go into detail as to the manner of regulating these operators. To do so would be impracticable. The details must be worked out by the regulatory body, based upon practical experience, and under the broad provisions of the proposed law, which require all rules and regulations to be just, fair and reasonable as to said two classes of companies in their relations to each other and to the public.

CERTAIN CARRIERS ARE EXCLUDED

The proposed act excludes from regulation motor-propelled vehicles operated wholly within the incorporated limits of any city or town. This, of course, is a matter resting within the discretion of the legislature in enacting the law. We believe a majority of states now

engaged in regulation of motor-propelled vehicles do not undertake the regulation of companies operating exclusively within city limits. This is a matter, of course, to be determined by the legislative policy of each state. If it is desired that such power be exercised, this exception should be stricken from the definition of auto transportation companies contained in the proposed act.

It will also be noted that motor-propelled vehicles, operated exclusively in the transporting of agricultural, horticultural, dairy or other farm products from the point of production to market, are excluded. This is a wise provision, particularly in the Western states, where the movement of bulky crops, such as apples or wheat, requires the use of every available truck in the vicinity for a short period of time. To require every truck engaged in hauling wheat or apples from the field or orchard to the railway station or local market to secure a certificate of convenience and necessity, furnish a bond, and conform to other regulatory details, would place a needless burden upon producers, operators, and regulatory bodies alike. School buses are also excluded. There may be a difference of opinion as to this exclusion. We are inclined to the view that they should be excluded but that some legislation should be enacted requiring such buses to be insured or bonded so as to provide indemnity for careless operation.

CERTIFICATES FOR CLASS A ONLY

Another question might be asked: Why require Class A companies to secure certificates of public convenience and necessity and at the same time authorize the granting of permits with very little restriction to Class B companies? It would be impracticable to apply the certificate of public convenience and necessity to Class B companies as they are not limited to any definite route or schedule, and often operate in a wide stretch of territory. To determine whether public convenience and necessity requires an additional operator in this class would be a hopeless and impossible task. The fares, character of equipment, and method of operation can be properly regulated, and competition will largely eliminate the unfit. The regulation of fares will prevent the elimination of the smaller operators by the more powerful concerns through rate wars.

INSURANCE

That portion of the act relating to insurance should be drawn in harmony with the insurance laws of the particular state. Some legislatures have made the mistake of requiring too large a bond or insurance policy, compelling the payment of premiums almost prohibitive to many small operators. This provision should be flexible so as to permit the regulatory body to make reasonable regulations under which a small operator in a sparsely settled territory would be required to pay a

much smaller premium than a large operator in a densely populated district.

REASONS FOR PROPOSED FEE SCHEDULE

The proposed act undertakes to make regulation of auto transportation self-sustaining by requiring payment of certain fees by the companies. We believe this to be wise policy; first, because auto transportation companies enjoy certain privileges in the use of the public highways which other transportation companies do not enjoy, and, second, because the regulation of auto transportation is much more expensive in proportion to its volume than is the regulation of any other kind of transportation or any other public utility. Furthermore, it is doubtful, in view of the heavy burden of general taxation already existing, if the regulation of auto transportation would be undertaken by many states without some provision requiring operators to pay the cost of such regulation. The fee system which is proposed in this act is based largely upon the experience of the Department of Public Works in the State of Washington. It is believed that not to exceed 1 per cent of the gross operating revenue of auto transportation companies, together with the miscellaneous fees provided in the act, will yield a sufficient fund to finance the regulation of auto transportation companies in any state.

TAXES FOR USE OF HIGHWAYS

The fees so far discussed are those accruing to the state regulatory body for the sole purpose of covering expense of regulation. Some states are exacting certain taxes from motor vehicle companies as compensation for the use of the highways built and maintained at public expense. It is very likely that exactions of this character will ultimately be made in all of the states. There is a growing sentiment in favor of such a tax and a feeling upon the part of the public that stage and truck competition as now permitted is unfair to rail carriers, who are compelled to purchase right-of-way, construct grades, lay ties and steel, and maintain such structures at their own expense and pay taxes thereon.

While the exaction of taxes from auto transportation companies other than a sufficient amount to cover the expense of regulation is more properly a function of the taxing authorities of the states, it may not be improper briefly to discuss the same in this report. The statute which we have proposed places trucks and for-hire cars under regulation so that it will be possible to require such concerns to furnish statistical information upon which a reasonable tax may be formulated. To impose a gross revenue tax upon the earnings of vehicles operating between fixed termini and over a regular route without imposing an equal tax upon truck and passenger vehicles not so operating would work an injustice.

For instance, in the State of Wash-

ington, 36,323 truck licenses have been issued thus far in the year 1923. Only 284 of these are subject to regulation under the statute, which applies only to operations between fixed termini and over a regular route; 2,098 licenses have thus far been issued in 1923 for stages and for-hire cars, of which only 656 are subject to regulation.

About a year ago, the Department of Public Works of the State of Washington placed inspectors at strategic points on the highways who kept a check day and night for a limited period of all traffic being handled by trucks over the highways. This check disclosed that only about 20 per cent of the traffic passing such points was being transported by regulated freight carriers. No doubt a similar state of facts exists in other states.

If the proposed act should become a law, all of the concerns engaged in the transportation of either persons or property for compensation would come under some form of regulation and could be required to make such reports and furnish such statistical information as would enable a proper tax to be imposed.

There is still another class of vehicles, such as trucks engaged by private industries in transportation of their own products, such as oil companies, logging and lumber companies, creameries, and so forth, in relation to which difficulties would unquestionably arise in the imposition of a tax as compensation for use of the highways. It is also true that trucks so operated, though likely to escape the taxes imposed upon common carrier operators, are usually more heavily loaded and more injurious to the highways than those of any other class.

GASOLINE TAX

At the present time the only form of taxation that operates equitably upon all users of the highways is the gasoline tax. Such tax would, of course, affect all who use the highways in proportion to the use they make of the same. The heavier the load, the more gasoline required to transport it. The only difficulty is that the gasoline tax must be paid by those who use the highways for pleasure as well as those who use them for profit. A number of states now impose a gasoline tax of two cents per gallon, which yields a handsome revenue. To increase this tax would work no injustice to the operators who use the highways for commercial purposes but, in the opinion of many, would be unjust to private car owners, who do not use the roads for gain and who have borne their share of taxation for the construction of the same. In any event, it is doubtful if legislatures will be inclined to increase the gasoline tax beyond the 2-cent limit unless the excess over the two cents could be made to apply to commercial users of the highways only; and, to make such distinction, would result in great difficulty and uncertainty of administration.

In imposing any form of taxation based on gross operating revenue, care should be taken not to destroy small operations in isolated regions. If it can be legally done, a reasonable return might be permitted tax-free to each auto transportation company, such return to be based on the value of the property devoted to public use. The rate of return might properly be prescribed by the state legislature and the value upon which it is based determined by the state regulatory body. All revenues in excess of such reasonable rate of return could then safely be taxed for the purpose of building and maintaining highways. In this way, the small operators, whose rate of return is usually low, would not be eliminated; and the larger concerns in thickly settled communities, whose operations are usually in competition with established rail and boat lines and whose earnings are usually ample, could be more heavily taxed without injustice.

ACCOMMODATIVE SERVICE EXCLUDED

In defining the words "for compensation," the following exception is made:

"An occasional accommodative transportation service by a person not in the transportation business, while on an errand for himself, shall not be construed as a service for compensation, even though the person accommodated shares in or pays the cost of the service."

The purpose of this provision is to save the kindly disposed individual and the regulatory body the annoyance occasioned by complaints arising from the occasional accommodative transportation of an article or of one person by another. In other words, regulation should not be so hidebound that a man could not accommodate a neighbor without violating the regulatory statutes.

Unions Must Develop Responsibility

DR. WILLIAM STARR MYERS, professor of politics Princeton University, was the principal speaker at the annual dinner of the New York Railroad Club, held at the Commodore, New York, Dec. 6. Dr. Myers' address was entitled "Thoughts on Our Present Discontent." Expressing himself as favoring the existence of labor unions, he also advocated the open shop—not "a shop open to none but non-union men, but to union and non-union men without distinction." He advocated making the unions really democratic by breaking up the "close corporations" of union leaders who control policies and finances, and the incorporation of the unions. He declared that they should assume the legal responsibilities commensurate with their rights and that if the unions did not reform themselves, it might be necessary for the government to step in and control their elections and their finances. The difficulty of today, he said, is not primarily with the rank and file of labor, but with the leaders, who seldom are

elected by really democratic methods, who have control of the policy of the organization, are practically a self-perpetuating and "close corporation" in many cases, and are totally irrespon-

sible for the administration of the finances.

The dinner was the largest ever given by the club and about 2,600 were said to have been present.

Resolutions and Further Committee Reports of Commissioners

Would Clarify Jurisdiction of State Commissions and Interstate Commission and Have Latter Value Railroads by States—Conference to Be Called on Crossing Accidents

AT THE closing meetings in Miami last week of the National Association of Railway & Utilities Commissioners, the following were elected officers for the ensuing year:

President, Henry G. Taylor, chairman Nebraska State Railway Commission; first vice-president, W. D. B. Ainey, chairman Public Service Commission of Pennsylvania; second vice-president, A. G. Patterson, president Alabama Public Service Commission; secretary, James B. Walker, secretary New York Transit Commission; assistant secretary, Lewis G. Thompson, Florida Railway Commission; general solicitor, John E. Benton.

RESOLUTIONS OF INTEREST TO ELECTRIC RAILWAYS

Resolutions passed, of interest to electric railway companies, included the following:

That Congress be urged to make such amendments to the existing transportation law as shall clearly exclude from the jurisdiction of the Interstate Commerce Commission the regulation of the rates and service of electric railroads carrying on local street railway transportation.

That the president of the association call a national conference, consisting of representatives of the carriers, state regulating commissions, governors, highway commissioners, municipal officers and national automobile associations, to see what can be done to reduce accidents to automobiles at railroad grade crossings.

That Congress be urged to supply the Interstate Commerce Commission with sufficient funds so that it may report valuations of railroads by states, as well as by entire systems, the commission having reported that it has been unable to make this division in the past because of lack of funds.

That Congress so amend the interstate commerce act as to remove all question of continued power of the state authorities to require common carriers to make additions and betterments to their plant and facilities reasonably necessary for the safe and proper service of the public; that no intrastate rates may be changed or set aside without proof by competent evidence that such rate seriously affects interstate commerce, and that Congress amend the transportation act of 1920 so as to restore to the several states all the rights, powers and authority enjoyed by each state relative to certificates of convenience and necessity prior to the enactment of that act.

The report of the committee on valuation related principally to the Great Northern and Rock Island (steam roads) valuation cases. It is pointed out that the theory of the Great Northern Railway is that for the purpose of valuation it is assumed that the railroad is non-existent and therefore no portion of it available for the transportation of men or materials for the construction of other portions, and that the entire 7,000 main track miles will be reproduced in from two to three years. Under this theory, material would necessarily be transported over foreign lines of railroads and no part would be hauled over the lines of the Great Northern Railway itself, and the freight on the material hauled would be

paid for at class rates. Such an assumption, the report says, is illogical.

A supplement to the report considers the question of valuation of ill-conceived railroads, in connection with one or two recent decisions on this subject on steam road valuations by the Interstate Commerce Commission. The committee believes that for such properties the method of determining value by means of the cost of reproduction is not appropriate.

OTHER REPORTS

The committee on uniform regulatory laws submitted an extended study of the railroad and utility laws in the different states. It makes up a printed pamphlet of more than 300 pages, the statutes on the same subject, as in existence in the different states, being grouped together. Many differences are found.

The committee on motor vehicle transportation submitted a report, of which an abstract appears in another column.

The committee on statistics and accounts of public utilities reported on a uniform classification of accounts for electric, gas and water utilities.

Further report on the proceedings at Miami will probably be published next week.

Subway Car Design Topic at A. S. M. E. Meeting

"MODERN Subway Cars and Their Operation," a paper by Selby Haar, assistant electrical engineer with the Transit Commission of the State of New York, was the principal topic at the meeting of the Railroad Division of the American Society of Mechanical Engineers, Dec. 5. E. B. Katté, chief engineer electric traction, New York Central Railroad, acted as chairman.

The paper by Mr. Haar gave various details of the steel car construction and equipment of trains used by the rapid transit lines in New York. These details have been published from time to time in various issues of *ELECTRIC RAILWAY JOURNAL*. Mr. Haar also referred to measures undertaken to overcome congested conditions in the subway so as to bring about a reduced time for loading and unloading passengers, thus reducing the time for station stops. This has enabled the operation of trains on more frequent headway, and the length of trains has also been increased, this latter requiring increased length of platforms. Ten-car express trains are now operated and six-car local trains.

Mr. Haar also referred to the development of the articulated train and declared that this type was being considered among other new designs for future equipment of the New York subways. According to the tentative designs, four units of this type will be substantially as long as eight of the standard cars. Each unit has a body of three sections, articulated and sup-

ported on four trucks. A special feature is that no intermediate end doors will be used, and there is but one guard for each unit and he is located at the end of the unit. Preliminary designs have wide single side doors instead of pairs of narrower doors.

The discussion following the presentation of Mr. Haar's paper showed the attention which has been given by designers of cars and equipment intended for New York subway service toward increasing schedule speeds, decreasing the length of station stops, and providing for the comfort and safety of passengers.

F. M. Brinckerhoff, who as a member of the L. B. Stillwell firm of engineers has devoted considerable time to the design of cars for New York subway service, described some of the features of the Brooklyn-Manhattan Transit Corporation's cars which were mentioned in Mr. Haar's paper. Mr. Brinckerhoff brought out the fact that in the development of this design considerable attention has been given to rapid interchange of passenger movement and to produce as light a car body construction as was advisable, in view of the extreme service to which this equipment is subjected.

Joseph C. McCune, district engineer Westinghouse Traction Brake Company, New York, described some of the advantages of the electro-pneumatic brake equipment and the empty and load brake device as installed upon the Brooklyn-Manhattan Transit Cor-

poration's cars. He brought out the fact that the improvements in air-brake equipment had done considerable toward decreasing the congestion of rapid transit operations by providing increased rates of retardation, quick release of brakes and rapid recharge of the air-brake system. He said that the distance for a stop of the Interborough trains from a speed of 40 m.p.h. has been more than cut in two by improvements in air-brake equipment and that the time taken to stop from this speed has been decreased one-third. Mr. McCune also described the features of the automatic air and electric couplers as used on subway equipment, and gave some illustrations of the saving in time that resulted in making up trains for service.

Fred Butt, of the equipment department of the New York Central Railroad, gave some figures of the detentions in multiple-unit train service on the New York Central and asked several questions as to the value of certain equipment used on subway cars. H. L. Andrews, railway engineer Gen-

eral Electric Company, told of the efforts which his company had made to reduce the fire hazard on subway equipment by adopting flameproof and heat resisting insulation. He also spoke of the advantages of articulated units for train operation, and as evidence of the economies effected he declared that a three-car unit would have but four trucks and four motors, while three individual motor cars would require six trucks and at least six motors. The recently constructed two-car articulated unit used in Detroit has a weight of but 550 lb. per passenger seat.

George L. Fowler, consulting engineer, New York, told of the reasons for removing the coupler centering devices on the Brooklyn-Manhattan Transit Corporation's cars. The supporting attachment to the truck used to keep the couplers accurately centered produced large strains with danger of derailment. He also spoke of an investigation which he had made into the excessive nosing of these cars, which was found to be due to too free oscillation of the car body.

The first day was taken up entirely with meetings of sub-committees.

The committee voted to recommend the use of seven standard frogs for all radii of 130 ft. or less, using association standard spirals through the frogs. It was voted to use intermediate radii at even degree angles so as to make them coincide with the length of the curved heel arms for iron bound construction. Standardization of the length of frogs was referred to a sub-committee composed of Messrs. Angerer and Alden.

On the design of substitute ties, sub-Chairman S. C. Baker was directed to secure from the tie manufacturers or elsewhere a list of railways using such ties, extent of use, and particularly how many were placing repeat orders from time to time. It was also decided that a questionnaire should be sent out to all companies using substitute ties with the idea of developing data relative to this subject.

Mr. Wysor reported on the progress of the investigation by the welded rail joint committee. He outlined the status of the schedule of tests and research work recently adopted.

A preliminary report by Mr. Angerer on the design and specifications covering solid manganese crossings was approved.

The subject of standardization of switches and mates was discussed quite extensively. The committee requested each manufacturer member of the sub-committee to prepare and submit drawings showing a specified switch, so that a study can be made to ascertain the possibility of designing a composite switch. On the subject of standard design of narrow groove guard rail, Mr. Entwisle submitted a preliminary report and the sub-committee was instructed to continue the study of this subject.

A progress report was made by Mr. Haylow on the design of a standard hook-head spike, and each member was requested to furnish him with such additional data as they have on this subject.

A report by Mr. Spencer on surface hardening of rails was read, which described the results of recent experiments with this process in Toronto. Various data on this subject were submitted by different members.

Mr. Dunham reported progress on the subject of specification and design of tie rods.

It was voted to refer Specification Ws 10a to a sub-committee for action in accordance with the recommendations of the 1923 way committee.

It was decided to hold the next meeting at Easton, Pa., Feb. 13 and 14.

State Committee Men to Meet

ARRANGEMENTS are being made to have a round-table discussion of all directors of state committees on public utility information at the time of the midyear meeting of the American Electric Railway Association at St. Louis, March 4.

American Association News

Midyear Dinner Committee

THE committee on arrangements for the midyear meeting to be held in St. Louis, March 4, met in St. Louis on Dec. 11. It was decided to hold the meeting at the Hotel Chase, and E. B. Meissner, E. D. Payne and H. D. McBride were appointed a sub-committee to conclude negotiations with the hotel management.

The committee plans to engage the Chase Hotel orchestra, which is said to be one of Paul Whiteman's best. There will be special entertainment during the dinner. It was decided to print menu cards suitable to the occasion. It was planned to have a definite assignment of tables and places for all those whose reservations are received by Monday noon, March 3.

On the question of entertainment for the ladies, the committee thought that they could be well taken care of without the association making any special arrangements.

B. W. Frauenthal was designated to take up the matter of transportation to determine whether arrangements could be made for fare at one-half rate, as was done for the Atlantic City convention.

A hotel reservation sub-committee was appointed to follow all details of giving each member the rooms he wanted in so far as available. It was brought out that all attending the meeting can probably be taken care of within a radius of three blocks of the Hotel Chase. Frank O. Grayson, St. Louis, was appointed chairman of the hotel reservation committee.

It was suggested that an informal

get-together meeting be held on Monday night, just prior to the midyear meeting, and it is probable that this will be handled by the Birney Club, St. Louis. An organization committee was appointed for this purpose as follows: C. O. Birney, chairman; B. W. Stemmerick, R. W. Williams, Herman Spoehrer and B. W. Frauenthal.

The committee on arrangements will probably not hold another meeting until February of next year.

The following members of the committee were present: W. H. Sawyer, chairman; E. B. Meissner, F. G. Buffe, V. W. Berry for G. H. Clifford, L. E. Gould, H. J. Kenfield, C. E. Allen for M. B. Lambert, A. T. Perkins, Ernest Stenger, E. D. Payne for E. P. Waller.

In addition, Fred A. Kehl, H. D. McBride, J. A. Laird, Mr. Johnson for W. A. Layman were present from the St. Louis Electrical Board of Trade. From the Birney Club of St. Louis, C. O. Birney, Frank V. Cook, Otis E. Turner, F. A. Richards, R. W. Williams, B. W. Stemmerick, F. O. Grayson, and B. W. Frauenthal were present. Fred C. J. Dell represented association headquarters.

Way Committee

A TWO-DAY meeting of the committee on way matters of the Engineering Association was held in New York, Dec. 6 and 7. Those present were H. H. George, chairman; E. M. T. Ryder, C. F. Gailor, W. W. Wysor, W. R. Dunham, J. H. Haylow, E. B. Entwisle, C. A. Alden, R. B. Fisher, V. Angerer, R. C. Cram, sponsor, and G. C. Hecker, special engineer.

The News of the Industry

Mr. Mayo Discusses Transit

General Manager at Detroit Regards Construction of Underground Lines Downtown as Imperative

William B. Mayo, general manager of the Detroit Department of Street Railways, has issued a statement relative to the plans for rapid transit for the city of Detroit. Mr. Mayo analyzes critically some of the provisions outlined in the Rapid Transit Commission's report and states that in his opinion the conditions to be met in Detroit make it appear that the first logical step to be taken toward rapid transit is the construction of an underground tube in the central district, built first in short sections for surface car operation, but so designed that it can be converted to rapid transit operation.

DEFINITE ENABLING ACT NEEDED

The first consideration is to secure passage by the Legislature of a clean-cut enabling act. After that assistance and thought should be given to the question of the extent of the rapid transit system required in the next five or ten years. Mr. Mayo says that what the city really needs most is increased terminal facilities.

Mr. Mayo believes that careful consideration should be given to the relation between the Street Railway Commission and the Rapid Transit Commission, if the latter is to be a permanent feature, as unified operation can not be guaranteed unless one or the other is made definitely responsible for the transportation of the city's population.

A serious thing to be considered in connection with rapid transit development is the matter of fares. The surface lines must have at least a 5-cent rate of fare until the purchase contract is completed, Mr. Mayo believes, and rapid transit lines cannot operate for less than 10 cents until a ten-year period has passed or the total annual traffic has grown to somewhere near the billion mark.

FINANCING DETAILS DISCUSSED

In regard to the report of the Rapid Transit Commission outlining proposed methods for financing, Mr. Mayo is of the opinion that it is very unfortunate that the present enabling act retains the double column assessment plan. This he thinks should be eliminated. The bill referred to provides for a special assessment district along established routes by a so-called double column assessment. The first column would represent the value of a given parcel of land without a subway; the second column would represent the in-

crease by reason of the subway's construction. The same city tax rate would be levied against both columns, but the proceedings of the column due to alleged increased property value following subway construction would constitute a so-called special assessment fund to be used to pay for the subway work. This, Mr. Mayo believes, would entirely relieve the property owners of any real special assessment for a subway and conflicts with the apparent intentions of the Rapid Transit Commissioners.

If the second plan in the new act were adopted, he cites, the general assessment would be the same as the sum of the two columns suggested in the first plan, but would provide a genuine special assessment against the entire property value.

The new financial plan provides for an assessment at large of 17 per cent and a local assessment of 51 per cent, the balance of 32 per cent being the equipment cost which is to be financed by the car rider from the fares. This plan is not objectionable to Mr. Mayo except in the detail of its application.

Serious consideration of the metropolitan area and the Port of Detroit plans are recommended because the present transit plans contemplate the whole proposition as a local one.

Another feature of the enabling act to which Mr. Mayo called attention is the fact that the act seems to assume that all of the costs of changing gas and water pipes, telephone conduits, etc., shall be considered part of the cost for the subway. Inasmuch as a tremendous strain would be put upon the taxing power by the cost of the subway, it is apparent to Mr. Mayo that the settlement of this question should be a discretionary one instead of compulsory.

Moving Pictures to Tell Story.—Motion pictures are to be used in telling the story of the growth and development of many public utilities properties in the Central West, knit together in the Illinois Power & Light Corporation, formed last June by the merging of the McKinley and Studebaker interests. Pictures of the various properties and industries served will be taken in Illinois and Missouri. The pictures will show the tremendous growth of the public utility business and particularly the development of the many properties now under the management of the Illinois Power & Light Corporation, which operates a very large trunk line interurban railway and numerous city railway systems in seven states.

Recent Session of Union

One-Man Cars, Seniority and Other Matters Discussed by Amalgamated at Oakland Meeting

W. D. Mahon, international president of the Amalgamated Association of Street & Electric Railway Employees of America, reiterated his stand for the eight-hour day at the recent meeting of the association at Oakland, Cal. Mr. Mahon advocated one day rest in seven. Among other things he said that contracts covering labor agreements should be for two years instead of one and that there should be arbitration without suspension of work.

SENIORITY RULE DISCUSSED

During the proceedings a delegate from Vancouver suggested changing every two or four weeks between the day and the night men. The present association rule calls for seniority in selecting runs. The association voted for a pension plan for men members of more than twenty years' standing who had reached the age of sixty-five.

Mr. Mahon indicated that the one-man car was here to stay. The attitude of the officers of the association toward the one-man car was that the locals should try to get as much extra wages as possible for operating this type of equipment. It was recommended that the locals should be permitted to handle this matter. With further regard to the operation of these cars, Mr. Mahon said the men should be protected at crossings.

WOULD FIX SIZE OF ONE-MAN CAR

A recommendation was adopted favoring the passage of a law against one-man cars except those not more than 25 ft. long, with seats for not more than thirty passengers, equipped with an emergency exit door and automatic emergency control and brake, and on which the operator is not required to collect fares while engaged in operating the car.

It was further voted to increase the dues of the association.

In a talk which he made on the situation affecting the former employees of the International Railway, Buffalo, Mr. Mahon said:

Members of the Amalgamated throughout the country stood by the men in Buffalo and I want to say to their everlasting credit that they have helped to preserve the Amalgamated, and "Mittenism" is as dead as a door nail in the United States and Canada today.

My friends, what we have done in Buffalo has set a lesson; it has shown what we can do; and if all our members will only be as true and loyal as the men of Buffalo, and stand as they have stood, they will never defeat the Amalgamated Association on this continent.

Massachusetts Towns Worried

Begin to Fear for Their Future at Prospect of Withdrawal of Railway Service—Review of Affairs Affecting More than 80 Miles of Road

HOPE has been shattered that the Massachusetts Supreme Court would prove a modern Moses in showing the Northern Massachusetts Street Railway a way out of its sea of financial difficulties, enabling it to continue operation of its lines. Foreclosure by bondholders on Dec. 31 has been ordered unless the property has been disposed of as a whole, or in part, prior to that time. D. P. Abercrombie, the receiver, has been authorized to continue or discontinue service on all or any lines of the corporation at any time he may see fit, but it is anticipated that he will operate the greater part of the road until Dec. 31.

PUBLIC SHOWS ITS CONCERN

Threatened with the loss of virtually their only public means of transportation the residents of the possible trolleyless territory are beginning to show real concern. Gardner, one of the principal centers of the system, has asked its City Council to take action to provide transportation for residents, Templeton residents complain the town will be hard hit by the suspension of the lines, storekeepers and patrons in Athol are disturbed, and in the other towns served by the railway there is a growing realization of what the loss of the trolleys will mean.

The Northern Massachusetts serves far-flung territory, not very populous, it is true, but territory with a network of trackage that has knitted together a big section of the northern part of Worcester County. Even so, the facilities afforded by the railway have been at the command of approximately 125,000 persons, if not more. Nevertheless, in this territory there lives the type of suburban resident who believes in the convenience, yes, and even the necessity, of the automobile. The discontinuance of the lines will be no great hardship to this class of patrons except possibly during the winter months. The automobile owning class, however, is restricted in numbers. On the other hand, many daily wage workers will suffer who have not acquired the wherewithal for maintenance of motor cars.

At Orange, one of the extremities of the line, there is not much call for transportation of workers. It is a small town and few live sufficiently far from employment to find the trolley a convenience. It is, however, a necessity in travel to other towns. Starting there, the line runs to Athol, another thriving manufacturing town, spread out more and with greater need for adequate transportation facilities. This branch was formerly the Athol & Orange Street Railway. At one time, the travel between Athol and Orange was heavy.

The largest center beyond Athol for the Northern Massachusetts is Gardner, a city of population estimated at close

to 20,000. Big chair factories and other industries abound. While the working forces at Gardner are recruited largely within the city, the suburban territories send no small number of laborers. Gardner has two central villages and the travel between them is heavy. It has more modern stores than have surrounding towns and over the weekends draws throngs of shoppers, many of whom have found the trolley a necessity. The shopkeepers are the persons who really are worried at the passing of the trolley. They fear it will affect business, but are hoping there will come a way to meet the emergency.

Gardner is the center for the lines that pass through Templeton and its villages, where are virtually no trading centers. From Gardner there is also a branch that runs to Winchendon, another large town, the residents of which find the trolley very useful in traveling to the larger trading centers. There is a summer park between Winchendon and Gardner, maintained by the railway, that enjoys large patronage.

From Gardner the Northern Massachusetts main line runs through Westminster and into West Fitchburg, connecting with the lines of the Fitchburg & Leominster Street Railway. Fitchburg is an industrial city of 43,000 with up-to-date stores. It is the objective of residents living in towns and cities to the northwest, the very territory which the railway serves.

NO HELP FROM STEAM LINES

The railroads offer no avenue of escape to the residents confronted with the prospects of losing the trolley. There is passable steam service between Gardner and Fitchburg, but that is the extent of the railroad convenience offered. Between the other towns and cities now served by the trolley trains are few and far between and offer little inducement for travel by that means. They have not been a convenience and in many of the towns the railroad station is an impossible distance from the main village.

Other inconveniences are threatened. Three of the post offices, Templeton, East Templeton and Otter River, all receive mail by trolley. The accommodating trolley has also carried books between the branch libraries. Students attending the high school in Baldwinville, one of the villages of Templeton, are transported by trolley, as are many children attending elementary schools.

Residents of Templeton, overlooking their own patronage of the bus, place the blame for the predicament of the trolleys on the selectmen and the Gardner City Council. They declare the decrease of the trolley receipts is mainly due to issuance of jitney licenses.

In fact, Templeton is taking the trolley passing more to heart than most

of the towns. Leading residents fear the discontinuance will seriously hurt the few industries in its various villages as virtually all of the manufacturing plants get their fuel by way of the trolley. The discontinuance of such service will mean a long haul of coal as well as increased expense.

At a meeting in Athol on Nov. 26 it was voted to institute steps for the purchase of the section of the Northern Massachusetts Street Railway running between Athol and Orange, with a view to maintaining this line in operation after retirement of the Northern Massachusetts on Dec. 31. A committee composed of representatives of the two towns was appointed to canvass for subscriptions for the purchase of the line. Although sentiment favored the electric railway, a proposal has been made to put on several buses between the two towns.

Gardner's next move is, perhaps, the most eagerly awaited, for the trolley abandonment will be of direct concern to a larger number of people there than any other place. Already experts from a bus company are preparing a survey and report for the installation of a permanent bus line to take care of every possible transportation need. There are buses now in operation between some sections of the city drawing their chief patronage from the workers in the factories. There is no dearth of taxicabs operating almost on a jitney fare level between the Gardner railroad station and the center of the city known as West Gardner. They claim patronage is encouraging.

The only possibility of Gardner retaining permanent railway service is for the city or private interests to take over a part of the corporation's lines and operate them. This possibility is considered remote.

SIMILAR SITUATION ON CONNECTICUT VALLEY LINE

Judge DeCourcy of the Massachusetts Supreme Court on Nov. 16 ordered a decree entered directing D. P. Abercrombie, receiver for the Connecticut Valley Street Railway, to cease operating all lines of that system by March 1, 1924. The receiver is empowered to issue \$10,000 on a receiver's certificate to pay bills. Petitions for foreclosure of mortgages on lines of the Amherst and Turners Falls divisions have been filed. The court advised attorneys to confer concerning the sale of the company's properties and report to the court.

The Northampton Chamber of Commerce has considered how to keep the line from Northampton to Amherst in operation, and it is hoped that the Holyoke Street Railway will take over that line and also the line running from Northampton to Hatfield, operating these lines and allowing the section farther north, through Whately and Deerfield to Greenfield, to be discontinued. It seems probable that the service between Greenfield and Turners Falls will be replaced with a bus service.

Rental the Question—Report Praises P. R. T. Activities

After making a study of transit development in Philadelphia and the question of what rentals the Philadelphia Rapid Transit Company should pay, the transit committee of the Real Estate Board recently submitted a report saying that the issue, so far as new lines are concerned, is up to the new administration.

The report states that the size of the transit property the city will build depends on the amount of rent the Philadelphia Rapid Transit Company can afford to pay. This in turn resolves itself into the question whether it is better for the city to build a small transit property to serve a comparatively small number of people with rapid transit and get a high rent, or whether it is better for the city to build a larger transit property supplying rapid service to greater numbers and accepting a lower rental, but getting the additional interest on the investment through increased real estate values. In the opinion of the Real Estate Board's committee that is the question that will have to be settled in working out an operating agreement.

The report reviews the activities of the company during the present year in the matter of track extensions and new equipment saying that the company spent more this year than in any other year in this respect. Horace Groskin, chairman of the committee, said that this was proof that the Philadelphia Rapid Transit Company had not only kept faith with the worker in higher wages and with the stockholder in dividends, but also with the people of Philadelphia in the matter of service.

Removal of Part of New York Elevated Suggested

Julius Miller, Borough President of Manhattan, has proposed that the Sixth Avenue elevated structure be torn down and that a subway be constructed along its route without incurring the obligation of one cent on the city. His suggestion was contained in a communication to the Board of Estimate. Mr. Miller set forth that owners of property amounting to \$20,000,000 along the proposed route from the Battery to Fifty-ninth Street had agreed to submit to an assessment to bear the cost

Main Entrance at Wilson and Broadway to New Uptown Station, Chicago

of removing the elevated and building the subway, which is estimated at about \$25,000,000. He expressed the hope that the owners of all of the property involved, which totals about \$260,000,000, would agree to the project.

At an assessment of one-tenth of the value of the property, Mr. Miller pointed out, the financial burden would be lifted from the city and shifted to those whose property would benefit. He also proposed that the assessment be spread over ten years, which would result in a 1 per cent assessment a year.

Mr. Miller brought his plan up at this time because the Board of Estimate had called a public hearing on Dec. 14 on relocating the columns of the Sixth Avenue elevated structure. He has already asked the Corporation Counsel to frame a bill giving the city the right to go ahead with his project.

Orders Physical Connection in Tulsa

The Oklahoma Corporation Commission has issued an order requiring the St. Louis-San Francisco Railway and the Sands Springs Railway to make physical connection with the Oklahoma Union Railway at Tulsa so as to facilitate the handling of freight in carload lots and less over the lines of the Oklahoma Union Railway. The Oklahoma Union Railway operates an electric interurban line between Tulsa and Kiefer, Okla., a distance of 18.84 miles.

New Uptown Electric Station in Chicago

The Chicago Elevated Railroads and the Chicago, North Shore & Milwaukee Railroad have augmented the station facilities at Wilson Avenue, formerly laid out primarily to serve the elevated, by the construction of a new depot underneath the elevated structure. The new station is of quite imposing appearance, both inside and out. It is located on the north side of Wilson Avenue at the intersection with Broadway, which is at the center of the uptown district on the North Side. It will serve the through passengers of the North Shore line and the Evanston division of the elevated. Local passengers from and to Wilson Avenue will be handled from the station on the opposite side of Wilson Avenue, and therefore the local and through passenger business will be separated.

The building is of brick and tile construction with terra cotta facing. The interior is decorated with art marble for flooring and side walls up to the height of the wainscoting. The grand staircase leading up to the track level is exceptionally attractive and provides a generous passageway for passengers. The total cost of the building, including the cost of removing the building which previously occupied this site and was owned by the elevated railroad, was approximately \$200,000.

Wages Advanced 1.65 Cents in Philadelphia

As was reported in the *ELECTRIC RAILWAY JOURNAL*, issue of Dec. 8, the Philadelphia Rapid Transit Company has granted a wage increase to its trainmen, effective Jan. 1, 1924 amounting to about 1.65 cents an hour over the 1923 average scale. Under the new agreement the men will receive 67½ cents and of that 2½ cents will go into the dividend fund. At the end of the year each employee will be credited with 10 per cent of his year's earnings. The new basic rate is placed at 65 cents and with the 10 per cent wage dividend it will amount to 71.5 cents. In 1923 the average rate has been 63.5 cents with a 6.35 wage dividend. Employees of the Philadelphia Rapid Transit Company are paid by agreement according to the average paid in Cleveland, Chicago and Detroit. The increase involves an outlay of approximately \$550,000 to the company.

Discussing the wage matter President Dunbar said:

At the beginning of 1923 the wage based on the trainmen's 62.5 cents per hour was thought to be as high as wages would go. This, with a 10 per cent co-operative wage dividend thereon, was considered possible of accomplishment. When the three-city average wage brought up to 64 cents an hour on May 1 the wage dividend was still thought possible of accomplishment, but when the three-city average went to 67.5 cents June 1 it was at once seen impossible to pay this large increase and in addition pay a 10 per cent co-operative wage dividend.

Upon the explanation being made that the continued purchase of P. R. T. stock for the workers' account depended upon the payment of the full 10 per cent wage dividend, all employees at once agreed that the equivalent of 3.5 cents per hour should be deducted from the three-city average wage, to which they were entitled, and paid to the trustees of the wage dividend fund, the wage of 64 cents per hour being thereby continued.

President Dunbar referred to Mr. Mitten's desire to have the basic wage at 65 cents an hour. He said that the company, however, would have to make up the \$50,000 which it was short in the full earning of the present year's \$1,850,000 wage dividend, but that even with that in mind he strongly approved increasing the basic wage to 65 cents and endeavoring to earn and pay a 10 per cent co-operative wage dividend during 1924.

Rockford Traction Applies Again for Franchise Grant

The Rockford City Traction Company has made a second application to the City Council of Rockford, Ill., for a franchise grant. The last franchise application was voted down in a referendum on Dec. 12, 1922. In the present application the company proposes not to pay for any new paving or repaving of any street upon which its tracks are now or shall later be laid. It proposes, however, to pay for repairs to pavements within the length of its cross ties, with such materials as may be ordered by the City Council.

With the exception of the paving clause the franchise application is practically the same as the original one, including the rate of fare, double tracks on Seventh Street, relaying of rails

on State Street in business districts and extension of lines to city limits on East State Street and to Black Hawk Park on Fifteenth Avenue.

The new traction application makes no provision for a referendum. Early action on the franchise application by the Council is expected.

The company's franchise expired on Oct. 3 last, and the company has been operating since that time on a special permit granted by the Council.

Would Compel Railroad to Halt Cars at Crossing

A hearing was held before the Public Service Commission on Dec. 5 on a complaint filed by the State Bureau of Highways against the Hudson Valley Railway, Glens Falls, N. Y., asking that the crossing at grade at the Waterford-Mechanicsville county highway and said company's railway shall be protected. The crossing in question is located immediately north of Waterford on the highway leading from Albany, Troy and Cohoes to Saratoga and points north. The highway will be reconstructed next season. The State Highway Bureau at the hearing asked for an order directing the cars of the railway to come to a dead stop before crossing the highway. It was shown that there are nineteen passenger trolley cars and four express cars that cross this highway daily, together with about 1,500 automobiles. The automobile traffic will be heavier when the highway is rebuilt of concrete.

The decision of the commission will be announced later and will be received with more than ordinary interest, as the request itself "to bring transportation to a stop before crossing a highway" marks a departure from the accepted practice of a railway crossing a highway, almost since the inception of the railway itself.

Recent Booklets Furnish Excellent Examples of Publicity

Three examples have recently been presented of real efforts by utilities to tell their story to the public through the printed page. The corporations issuing the booklets are the Public Service Corporation of New Jersey, the Middle West Utilities Company and the United Light & Railways Company. The Public Service booklet is one of eighty pages. It covers the twenty-year period of the company from 1903 to 1923. Twenty years of real service furnishes the text. More than 60,000 copies of the booklet have been distributed. The Middle West booklet is one of sixty-four pages. It is entitled "Essential Service in Fifteen States." The United Light & Railways has seized upon the results secured by it during the year 1922 to tell its story. This is essentially an annual report, but it is excellently arranged and has been made most readable by the presentation of considerable material not until recent years regarded as suitable to be introduced into such matter of fact affairs as an annual report.

Full Operation Restored in Saginaw

Full operation has been restored by the Saginaw Transit Company, Saginaw, Mich. It is believed that in this respect a record has been established. It was on Sept. 26 that the car shops were opened and repairs to equipment started. New switches were laid, track and overhead repairs made. Cars were made ready for operation, and twenty-five buses were ordered. Twenty are at Saginaw and in service. Thirty-two street cars are at present available for service.

During the first month's operation with competition from jitneys and only 25 per cent of the equipment in use, the company carried 466,800 passengers. Of these, 393,307 were revenue passengers, 73,027 transfer passengers and 466 rode on passes. On Dec. 8 the company carried nearly 30,000 revenue passengers. This is much better business than was expected, Charles S. Kressler, general manager of the company, said.

The company has ninety-two operators, nearly all of whom knew little or nothing about street car or bus operation prior to Nov. 1.

The return of street cars has caused a traffic problem. The City Council wants two men on the double-truck cars to facilitate loading and unloading. Mr. Kressler says this means receivership for the company. He advocates the construction of loading docks in the business district to relieve the congestion. The Council will probably follow his suggestion.

Maine Company Seeks Relief from Reconstruction Order

The Public Utilities Commission of Maine will hear the appeal of the Androscoggin & Kennebec Railway, Lewiston, from certain regulations and requirements made by the municipal officers of Brunswick relative to the reconstruction and resurfacing of Main Street in that town. The regulations ordered the railway to reconstruct a certain portion of Main Street and stipulated that the expense of resurfacing the track location should be paid by the company, and the expense of the cement surfacing of the remainder of the street should be assumed and borne by the town of Brunswick. It is the contention of the railway that the municipal officers acted entirely beyond their authority, for it claims that about one-half the total distance named in the order is entirely covered in, and constitutes the subject matter of an order of the Public Utilities Commission, dated July 11, 1921, which is still in force and with which the town of Brunswick has neglected to comply. The company also maintains that the requirement that the company bear the entire expense is unjust and unreasonable, and that the character and kind of paving and resurfacing ordered are unreasonably expensive and unnecessary.

Railway Secures Injunction to Prevent Discrimination.—The Waterloo, Cedar Falls & Northern Railway has been granted an injunction against the city of Cedar Falls, Iowa, restraining the city from enforcing an ordinance compelling buses to follow certain routes within the city limits. The road alleged discrimination by the City Council between buses operated as an adjunct to the railway between Cedar Falls and the Iowa State Teachers College on Normal Hill and buses operated by a rival company.

Franchise Granted.—The franchise of the Tri-City Railway asking permission to operate its cars into Milan, Ill., without further hindrance was granted T. C. Roderick, general manager of the Illinois division, by the Milan village board of trustees in session. The franchise is for twenty years.

Elevated Will Be Continued.—Contrary to statements early in 1923 that the Public Utilities Department of Seattle planned to abandon the municipal elevated railway paralleling the waterfront, Superintendent of Railways D. W. Henderson states that the elevated will be continued in use, as at present. In order to reroute the cars so as to abandon the elevated, it would be necessary to build a long trestle, an expensive structure for which the Seattle Municipal Railway has no funds available at present.

Must Explain Failure to Build.—The Wisconsin Railroad Commission, concerned at the thirteen years' delay of the Milwaukee Western Electric Railway to begin construction of its proposed electric railway from Milwaukee to Beaver Dam and from Sussex to Waukesha, has requested executives of the company to appear before the commission at a hearing to present facts, plans and other data involving the building of this line. Certificates granting permission to begin construction and operation of the line were issued in 1910.

Would Reconsider Roof Erection.—The City Council of Youngstown recently passed and later voted to reconsider a resolution authorizing the Pennsylvania-Ohio Electric Company to increase its capital stock to permit the erection of roofs on the loading platforms in Central Square. Council President Backus announced that he had not signed the ordinance because he believed it contained no provision for a decrease in capital stock if later the platforms should be removed. Commissioner Engle added that according to the franchise such increases remain permanent. The amount involved is \$3,000.

Will Investigate Accidents.—John P. Stouch, former city commissioner and city controller, has been named as investigator of accidents, in the claims department of the Altoona & Logan Valley Electric Railway, operating in Altoona, Tyrone and Hollidaysburg. The position is a newly created one. Mr. Stouch will investigate all reports, taking over that branch of the work handled by Attorney Samuel B. Hare.

Hearing on Shawmut Branch.—The Public Utilities Commission by an act of this year's Legislature held a hearing recently to determine what price, not exceeding \$1,000,000, the city of Boston should pay the New York, New Haven & Hartford Railroad for the tracks, roadbed and other equipment of the Shawmut Branch. The act provides for the purchase by the city of the Shawmut Branch in connection with the new rapid transit extension in Dorchester, which, it is estimated, will cost about \$4,000,000. This extension has been referred to previously in these

columns. Attorney Joseph P. Lyons, assistant corporation counsel for the city, who attended the hearing, said the city in financing the project would make a profit because the act provided that the Boston Elevated, which is to use the tracks, shall rent the property from the city and shall pay one-half of 1 per cent more than the city pays in interest on the bonds, this amount to be placed in sinking funds and used to pay off the bonds. The city, according to Mr. Lyons, would therefore ultimately get its money back and still own the branch.

Foreign News

Progress Slow on Central American Property

During 1922 some progress was made on the Government railway (Ferrocarril de los Altos) to connect Quezaltenango with the International Railways of Central America at San Felipe. Work was begun on this railway several years ago, but because of the war, the difficult engineering problems involved, and heavy construction costs, progress has been very slow. The motive force is to be electricity. The electric equipment and railway material are being purchased in Germany.

Trolley System as Auxiliary in Salvador

It is proposed to install a trolley system to replace the storage-battery cars now running on the main line of the International Railways of Central America, Salvador Division. This trolley system will be used merely for trips through the main streets of the city of San Salvador to and from the station.

Electrification Progress in London District

Electrification plans of the Southern Railway of England are progressing and construction work is now being begun. This company is a consolidation under the railways act of 1921 of the London & Southwestern Railway, the London, Brighton & South Coast Railway and the Southeastern & Chatham Railway. Each of these companies had electrification schemes for its suburban lines leading out of London, the first two for extensions and the Southeastern for an initial installation.

The accompanying map shows the extent of the electrification ordered. On the southwestern section, formerly the London & Southwestern Railway, plans have been approved for the extension of the electrification to Guildford and Dorking. This work, along with that on the other sections, will cost about £5,000,000, and it is intended that it will be completed by the end of 1925. The arrangements will pro-

vide for carrying on the electrified lines 200,000,000 passengers per annum.

Altogether the Southern Railway now has 85 miles of route and 248 miles of track of electrified lines. This will be increased to 145 miles of route involving 358 miles of single track.

The following figures give the estimated cost of the electrification.

LONDON, BRIGHTON & SOUTH COAST SECTION

Line equipment £276,600
Motors and trailers 395,000

SOUTHEASTERN SECTION

Conductors and rails £786,000
Electric equipment of rolling stock. 730,000
Substations and d.c. feeders 720,000
Conductor rails and track bonding. 515,000
Electric light and supply system. 200,000
High-tension feeders 315,000
Repairs to stations 300,000
New car sheds 100,000
Repair and inspection shops. 110,000
Signaling, permanent way, drainage, etc. 324,000

SOUTHWESTERN SECTION

Extension to Guildford and Dorking £840,000

The "Underground" Extension to Hendon

The London Electric Railways has opened its extension from Golders Green to Hendon, Central, together with an intermediate station at Brent. The new portion of railway is 1.63 miles in length. The work includes, in addition to the two new stations at Brent and Hendon, an enlargement of the Golders Green Station, a fine girder bridge across the Golders Green Road, and a viaduct, 30 ft. high, over the River Brent. An extension, 3.05 miles in length, is also under construction forward to Edgware, with intermediate stations at Colindale, 1.31 miles, and at Burnt Oak, 2.21 miles from Hendon. From the terminus at Edgware to that at Clapham Common will be 16.44 miles, which will be covered, without any change of carriage, in 49 minutes.

Line Under Construction in Bolivia

An electric line in Bolivia, 56 miles in length, is under construction. It will extend from the town of Cochabamba toward Chemore.

Financial and Corporate

Reorganization Affairs Reviewed

Committees Representing Kansas City Railways Holders Issue Appeals and Consider Prospects

A circular dated Dec. 8 has been addressed to the noteholders of the Kansas City Railways to inform such holders regarding the status of affairs of the Kansas City Railways. Accompanying the circular is a preliminary report of the reorganization committee. It is explained that the reorganization committee was formed recently through action taken by the committee representing the noteholders and by the committee representing holders of first mortgage bonds.

The membership of this committee is composed as follows: Melvin A. Traylor, president of the First Trust & Savings Bank, Chicago, chairman; H. L. Stuart, Halsey, Stuart & Company, Inc., Chicago; J. K. Newman, Newman, Saunders & Company, Inc., New York; J. F. Downing, president of the New England National Bank, Kansas City, Mo., and P. W. Goebel, president of the Liberty National Bank, Kansas City, Mo., and the Commercial National Bank, Kansas City, Kan.

COMMITTEE REPORTS PROGRESS

The reorganization committee explains that it is doing everything possible to expedite reorganization. It says that it has made a tentative settlement of the litigation, controversies and claims arising as a result of personal injuries and damages prior to the receivership. This settlement contemplates that a plan of reorganization will be submitted in the near future for approval by the various security holders and other creditors. The committee says, however, that in the event an adjustment of the various claims against the company is not secured the first mortgage upon the property will be foreclosed.

So far as the operation of the property is concerned, the committee explains that for the first ten months of 1923 the total income from all sources was practically the same as for the similar period of 1922. Net earnings, however, showed an increase. Revenue passengers for the first ten months of 1923 numbered 112,436,921, as compared with 112,325,578 for the first ten months of 1922. In view of the very intense jitney competition at the commencement of the receivership, the elimination of the jitney as a factor in transportation at Kansas City is regarded as a very important accomplishment.

On Dec. 7 the holders of the second

mortgage bonds, Series A and B, of the Kansas City Railways were addressed in regard to the affairs of the company. At the suggestion of a number of holders of these bonds a committee has been organized consisting of Eugene V. R. Thayer, New York, chairman; Frederick J. Horne, vice-president of the New York Trust Company, and H. P. Wright, H. P. Wright Investment Company, Kansas City.

The original protective committee represented all issues of the funded debt. As the circular to the holders of the second mortgage bonds explains, there were apparent certain conflicts of interest between the issues of securities represented with the effect that the protective committee found it advisable to discontinue representing the bond-secured notes and the second mortgage bonds. The original committee, changed somewhat as to personnel, continued to represent the first mortgage bonds. A separate committee was formed to represent the noteholders. No committee was formed at the time to represent the second mortgage holders. In making its plea for deposits the committee representing the second mortgage holders said:

Recently, in anticipation of a reorganization, the committees representing the first mortgage bondholders and the secured noteholders appointed from their number a joint reorganization committee. This committee has entered into negotiation with various classes of creditors claiming priority, including the personal injury judgment creditors and claimants, in an attempt to work out an amicable solution of the controversies and accomplish a reorganization without the delays and expense incident to final judicial determination of the issues involved in the litigation. Conditional agreements have been arrived at between certain of the interests. The court has indicated a desire, and it is obviously essential, that representatives of the second mortgage bondholders be constituted and empowered to negotiate and, if found advisable, conclude amicable agreement with reference to the second mortgage bonds, or, as an alternative, to continue the litigation if need be.

As has been indicated previously in the *ELECTRIC RAILWAY JOURNAL*, the court has set Dec. 27 as the day for hearing and passing upon such agreements as may have been made between the various claimants and has stated that, in the event substantial progress toward amicable adjustment has not been made at that time, the matter will be set down for judicial determination on Jan. 7.

Receiver's Duties Extended

A. L. Reynolds, general manager of the Washington-Virginia Railway, has been appointed receiver for the property of the company in the District of Columbia by Justice Hitz in the District Supreme Court. Mr. Reynolds had previously been appointed receiver for the company in Virginia by Judge Brent in Circuit Court at Fairfax.

Provides for Expansion

United Light & Railways Company Arranges for Larger Capitalization —Special Dividends Declared

Changes in the corporate structure of the United Light & Railways Company, Grand Rapids, Mich., to provide for prospective growth and development have been announced.

At the present time the combined debt and capital stock of the company, at face value, total \$55,917,253, the capitalization of outstanding stock of the United Light and subsidiary companies in the hands of the public amounting to \$23,120,453 and the fixed debt totaling \$32,796,800. The new capitalization will be "substantially larger," it is announced.

The corporate title of the new company will be the United Light & Power Company. It will be organized under the laws of Maryland. The present company is a Delaware corporation. Elimination of inheritance taxes for non-resident stockholders, issuance of stocks of no par value, and distribution of more profitable securities to stockholders are listed as some of the major advantages of the new plan.

All of the assets of the old company, subject to mortgage liens and indebtedness, will be sold to the new United Light & Power Company, and the securities of the latter will be distributed in equitable proportion, according to classes and preferences, to the stockholders of the United Light & Railways Company, the present corporation.

It is announced in the same connection that the old company will acquire in the near future all of the common capital stock of the Iowa Electric Power Company, which will construct, own and operate a large power plant on the west bank of the Mississippi near Davenport, Iowa. Erection of this power station has already been announced in this publication.

The Grand Rapids, Grand Haven & Muskegon Railway, the Mason City & Clear Lake Railroad and the Tri-City Railway are among the railways controlled by the company.

DIVIDEND DECLARATIONS ANNOUNCED

At a meeting of the board of directors of the United Light & Railways Dec. 6 the regular quarterly dividend of 1½ per cent was declared on the first preferred stock of the company, payable Jan. 2.

There was also declared the regular quarterly dividend of 1½ per cent on the participating preferred stock of the company, payable Jan. 2. A special dividend of one-quarter of 1 per cent on the participating preferred stock, payable Jan. 2, 1924, was declared at the board meeting which was held on March 8 last.

There was also declared the regular quarterly dividend of 1½ per cent and an extra cash dividend of three-quarters of 1 per cent on the common stock of the company, payable on Feb. 1, 1924, to common stock holders.

Selling Stock Part of Employee's Job in Quincy and Peoria

All divisions of the Illinois Power & Light Corporation, Chicago, are actively engaged in the campaign for selling the 7 per cent preferred stock which is being offered only in the State of Illinois. Large cards advertising this stock will be placed in the interurban cars, and folders describing the stock and how it may be purchased will be carried in all the cars. The cars in Peoria and Quincy are now carrying front-end banners reading "7 37/100 per cent with Safety—Ask the Conductor." Here it is that the conductor has the advantage of explaining in detail how it is possible to invest in the preferred stock of the Illinois Power & Light Corporation on a basis that gives a liberal and regular return. In many cases, according to "Current Topics," the official publication of the company, sales of stock have been traced directly to the conductor. This method of advertising is being used in Peoria and Quincy first, as these divisions furnish transportation service only and the employees there do not have the advantage of talking to their customers over the counter as do the employees of the electric and gas properties. Employees of the Illinois Power & Light Corporation are still privileged to buy its 7 per cent preferred stock on the same basis that has prevailed since the stock was first offered. Up to the present time about 61 per cent of the members of the company family are owners of the securities of their company.

Increase in Passengers Carried in Baltimore

The Industrial Bureau of the Board of Trade, Baltimore, has issued a report showing the number of passengers carried by the United Railways & Electric Company, Baltimore, for the first ten months of 1923 as compared with the corresponding period of 1922. The report follows:

	1923	1922
First six months.....	119,847,962	115,160,811
July	19,701,606	19,653,996
August	19,377,492	19,379,492
September	19,143,158	19,346,983
October	20,586,863	20,360,456
	198,657,081	193,901,738

Interurban Reorganization in Michigan Completed

Reorganization of the interurban system connecting Jackson, Lansing, Battle Creek and Kalamazoo, Mich., has been completed, according to announcement made on Dec. 10 by the reorganization committee. The system was formerly owned by the Michigan United Railways, which went into receivership in December, 1922. Former holders of the bonds of the Michigan United Railways are receiving under the reorganization plan \$500 face amount of the bonds of the new company and \$600 par value of its Class A preferred stock for each \$1,000 face

amount of the old bonds. Holders of debentures and preferred stock of the predecessor company are entitled to participate in the issue of Class C preferred stock of the new company.

As has been indicated before in the ELECTRIC RAILWAY JOURNAL, John F. Collins, the Federal receiver, will be operating manager of the Michigan Electric Railway, the successor company.

Auction Sales in New York

At the public auction rooms of A. H. Muller & Sons there were sold on Dec. 12 the following securities:

200 shares of Tennessee Electric Power, second preferred, \$47 per share.
\$55,000 of Boise & Interurban Railway first mortgage 5 per cent gold bonds, \$100 lot.
200 shares Interborough Consolidated, \$1 lot.
100 shares Interborough Consolidated Corporation, preferred, \$7 lot.

Court Suggests Settlement of Mortgage Liens.—Judge Moynihan in the Circuit Court at Detroit, Mich., has handed down a decision that an allocation of responsibility between the city and Detroit United Railway must take place for the purpose of settling a \$5,000,000 mortgage executed by the railway with a number of trust companies Jan. 24, 1922. The mortgage is one of a number of liens on the city lines of the Detroit United Railway when the latter were purchased by the city. Judge Moynihan invited attorneys for the city and the company to come before the court and agree to an equitable solution of the difficulty.

Loss Sustained.—The Dubuque Electric Company, Dubuque, Iowa, in the operation of its traction lines sustained a loss for operations during 1922 and 1923. Although figures show a book profit depreciation, replacement and other costs have not been figured. According to the report, the gross operating revenue in the railway department for the twelve-month period ended Oct. 31 last, was \$368,392, with total operating expenses of \$357,150.

Receiver Appointed.—Fred Alderman has been named receiver for the Hocking-Sunday Creek Traction Company, Nelsonville, Ohio. Mr. Alderman is an Athens, Ohio, banker.

More Lighting Properties Taken Over by Chicago Interests.—Properties of ten operating Missouri public utility companies in the central part of the state have been acquired by the newly organized Missouri Power & Light Company, Mexico, Mo., the common stock of which is owned by the North American Light & Power Company. The North American Light & Power Company is closely associated with the Illinois Power & Light Corporation in the ownership and management of public utility properties in Illinois, Missouri, Iowa, Kansas, Nebraska and Oklahoma. Another Illinois public utility property, that of the Monmouth Public Service Company, Monmouth, Ill., has been purchased by the Illinois Power & Light Corporation.

Another Hearing on Abandonment.—A further hearing will be held before Commissioner Pooley at Buffalo on Dec. 17 in the matter of the application of the International Railway for approval of a declaration of abandonment of part of its line in Niagara Falls.

Faces New Problem.—A new problem in finance confronts the Boston Elevated Railway. Having taken over the West End Street Railway, which formerly constituted the surface lines as distinct from the elevated lines of the company, it is now trying to fund some of the indebtedness and encounters a peculiar limitation. Under the laws of Massachusetts the Elevated can issue bonds equal to the stock plus the premiums paid into the treasury in connection with the sale of stock; but now it develops that the Elevated cannot issue bonds against the premiums that were paid in connection with the issuance of West End Street Railway stock. In the early days of railway operations in Boston high premiums were paid for both Elevated and West End stock, and if the Elevated today were permitted to take advantage of the West End premiums it could issue new bonds. The Elevated board of public trustees has petitioned the Legislature for legislation to remedy this situation.

Elected to Executive Board.—Travis H. Whitney, the Transit Commission representative on the board of directors of the Brooklyn-Manhattan Transit Corporation, has been elected a member of the corporation's executive committee.

Extra Common Dividend Declared by Canadian Road.—The Ottawa Traction Company, Ottawa, Ont., has declared an extra dividend of 2 per cent in addition to the regular quarterly dividend of 1 per cent, both payable Jan. 2, to stock of record Dec. 15. The stock is all of one class.

Mortgage Gold Bonds Offered.—A syndicate, headed by Harris, Forbes & Company, New York, N. Y., is offering \$8,500,000 of the Northern States Power Company first lien and general mortgage gold bonds, known as series A 6 per cent. The bonds are offered at 97½ and interest, yielding about 6.20 per cent. They are dated Nov. 1, 1923 and are due Nov. 1, 1948. Upon completion of the present financing the company will control practically all of the common stock of the Wisconsin-Minnesota Light & Power Company.

Foreclosure Action Against Interurban Averted.—Possible legal action by bondholders against the Oregon Electric Railway, operating in the Willamette Valley in Oregon, whose earnings have been below operating expenses, has again been averted by the announcement of the parent company, the Great Northern and the Northern Pacific, that the semi-annual interest due Nov. 1 on the \$2,000,000 of outstanding 5 per cent first mortgage bonds would be paid. The bond interest is \$50,000. The deficit for the current year is estimated by W. F. Turner, president of the Spokane, Portland & Seattle Railroad, the holding corporation, at \$300,000.

Traffic and Transportation

Startling Station Statistics

More Than 53,000,000 Fares Collected at Times Square Station in New York in One Year

The rapid transit traffic center of New York is for the first time at an uptown point. It has shifted to Times Square from Brooklyn Bridge during the past fiscal year. According to figures compiled by the Transit Commission from the reports of traffic at the various stations on the lines of the Interborough and B.-M. T. systems, the number of rapid transit fares collected at the Times Square stations went ahead of the number at the downtown traffic center by nearly 1,250,000. The figures just compiled are for the fiscal year ended June 30 last.

The fares collected at the Times Square station during the year were 53,835,135, as against 49,036,746 in 1922. At the Brooklyn Bridge center there were 52,613,113 passengers, as against 51,758,609 the year previous. Thus Times Square, with a gain of 4,798,389 passengers, forged ahead of the Brooklyn Bridge center, which gained only 824,504 passengers. The Times Square figures, moreover, include the fare collections only at the stations of the Interborough West Side subway and at the Broadway B.-M. T. stations, while at the Brooklyn Bridge the figures include collections for the Brooklyn elevated lines at the City Hall station of the Second and Third Avenue elevated lines, at the Brooklyn Bridge station of the Interborough East Side subway and at the B.-M. T. terminal beneath the Municipal Building.

Of the fares collected at Times Square, 34,678,063 represented traffic to the Interborough, and 19,157,072 to the B.-M. T. Incidentally, these figures show that these two stations are the largest from the standpoint of passenger traffic upon either of the individual systems. The Interborough traffic represented an increase of 2,711,826, while that on the B.-M. T. showed a gain of 2,086,563. Up to two years ago the traffic on the Interborough at Times Square was practically equal to that at Grand Central Station. While it has grown at the latter point, it has not grown at the rate which marked the increase at Times Square. The great bulk of the B.-M. T. line traffic has been developed in a little less than six years, the B.-M. T. station having been first placed in service on Jan. 5, 1918. The present Times Square station of the Interborough was opened to traffic on Aug. 2, 1918. The fare collections of both systems at Times Square were greater than those upon the entire length of several of the branches of both systems, exceeding for instance, combined totals

of stations on the Queensboro subway, the Pelham Bay Park Branch, the Jerome Avenue Branch and the Lenox Branch on the Interborough, and of several of the elevated and subway branches of the Brooklyn system.

Among the important Brooklyn traffic centers, together with the figures of passengers, are the following:

ATLANTIC AVENUE	
I. R. T. Atlantic Ave. Station....	15,620,943
B.-M. T. Pacific Street Station....	7,555,989
B.-M. T. Atlantic Ave. (Brighton Line) Station	2,050,452
B.-M. T. Atlantic Ave. "L" Station	1,581,295
	26,808,589
FLATBUSH AVENUE—FULTON STREET	
B.-M. T. Dekalb Ave. Station....	10,681,184
I. R. T. Nevins St. Station.....	8,918,798
B.-M. T. Fulton St. Line Station..	3,125,835
B.-M. T. Fifth Avenue "L" Line Station	1,496,376
	24,222,103
BOROUGH HALL	
I. R. T. Station	13,467,607
B.-M. T. Court St. Station.....	4,343,488
B.-M. T. Boerum Pl. "L" Station..	1,143,919
B.-M. T. Myrtle Ave.-Court St. "L" Station	964,081
	19,919,095

Of the above stations, Atlantic Avenue gained approximately 641,000 over last year; Flatbush Avenue and Fulton Street about 1,665,000, and Borough Hall about 450,000.

The most important stations, from the standpoint of traffic, on the Interborough system are the following, with the figures of fares collected in both the fiscal years 1922 and 1923:

	1923	1922
Times Square	34,678,063	31,966,237
Grand Central	33,137,199	29,938,128
Penn. Station	27,772,768	25,009,851
14th St. (E. S. sub-way)	18,430,910	16,966,522
Atlantic Avenue	15,620,943	15,545,431
Brooklyn Bridge	15,162,584	14,984,289
Borough Hall	13,467,607	13,845,912
Fulton St. (E. S. sub-way)	13,663,465	13,530,045
14th St. (W. S. sub-way)	11,840,502	10,949,399
86th St. (E. S. sub-way)	10,516,093	10,266,701

The most important stations on the B.-M. T. subway and elevated lines are as follows:

	1923	1922
Times Square	19,157,072	17,070,509
34th Street	16,434,286	14,723,077
Union Square	15,936,475	14,721,993
Coney Island Terminal..	14,908,399	13,868,226
Brooklyn Bridge ("L")	13,886,717	13,908,471
Chambers Street	13,808,395	13,238,249
Essex Street	11,776,459	11,126,708
Cortlandt Street	11,479,474	10,466,274
DeKalb Avenue	10,681,184	9,552,077

The total Interborough subway traffic last year was 676,650,431, a gain of 31,674,957, while the elevated traffic was 348,524,700, a gain of 7,484. The total B.-M. T. traffic, which is not segregated as to subway and elevated lines, on account of joint operation, was 480,900,869, a gain of 36,153,641.

Taxpayer Wants Cincinnati Fare Kept to Five Cents

Raising the new point that the Cincinnati Traction Company could not be permitted by the city of Cincinnati to charge more than a 5-cent fare, Attorney Robert S. Alcorn, as a taxpayer, has filed suit in the Hamilton County Superior Court against the traction company seeking to enjoin it from charging the present rate of fare, which is 8 cents, or any fare other than the 5-cent fare stipulated in the enabling act which was passed by the Ohio State Legislature and under which the railway system was leased to the traction company by the Cincinnati Street Railway.

At the time the lease was made the Cincinnati Street Railway had no other authority than was contained in the act, the petition declares, and it further sets up that no other authority different from that contained in the act ever has been procured or enacted by the Ohio Legislature. For this reason, Attorney Alcorn contends the Cincinnati Traction Company now can have no authority to charge more than the maximum fare charged by the Cincinnati Street Railway, its lessor, which was 5 cents for a continuous ride in the same direction.

It is the contention of Attorney Alcorn that, notwithstanding the city ordinances passed by Council under which the Cincinnati Traction Company increased its rate of fare the traction company could receive no authority so to do, because of the fact that such acts by the Council were inconsistent with the enabling legislation by the state, which never has been changed, he avers. Attorney Alcorn asks that the court enjoin collection of more than a 5-cent fare from passengers. City Solicitor Saul Zielonka was asked to bring the suit, but refused, Alcorn says.

Preliminary reports of the Cincinnati Traction Company for the months of October and November indicate the receipts of the company will not equal the amount necessary to meet the various items of the service-at-cost franchise, and that another increase of one-half-cent in fares is in prospect, Jan. 1. This will make the rate of fare 8½ cents. If the increase is determined upon—and that appears probable—official notice of the increase will be posted by the traction company on Dec. 15.

Railway at Youngstown Protests Jitney Licenses

The Youngstown Municipal Railway filed a protest on Dec. 4 with the Public Utilities Commission against the issuing of certificates under the new motor bus law to sixty Youngstown operators of "jitneys" who have made application for authority to operate. The applications are set for hearing Dec. 12.

Ross Raymond, head of the jitney men, filed the applications in Columbus. He is to file other applications

within a few days that will bring the number of jitneys licensed by the State to operate in Youngstown above the 100 mark, if the applications are granted.

The commission recently refused to grant Mr. Raymond a blanket franchise for all the jitneys and instructed him to make separate application for each.

The ordinance prohibiting jitneys from entering the congested district was passed by City Council of Youngstown Dec. 3 as an emergency measure.

Councilman Parrock fathered the ordinance at the request of Street Railway Commissioner Engle, who said that the "jitneys must go if the street railway is to exist."

The ordinance provides for a fine of not less than \$5 or more than \$10 for the first conviction and from \$10 to \$25 for subsequent convictions.

Allentown Employees Give Advice to Auto Driver and Owner

The Lehigh Valley Transit Company, Allentown, Pa., through its general safety committee is carrying on a campaign for the reduction of accidents between automobiles and its cars. The general safety committee called on patrons who owned and drove automobiles and talked to citizens relative to highway accidents in order that co-operation could be had between the drivers of automobiles and the trainmen of the transit company. This committee is composed of motormen and conductors of the Lehigh Valley Transit Company, who have compiled a few thoughts which they have printed in pamphlet form and are distributing to auto owners and drivers. The pamphlet gives in detail statistics of grade crossing accidents and general news of automobile accidents. It warns against careless driving especially in the coming holiday season. The pamphlet states that the committee is trying to do its part and is urging Mr. Auto Owner and Auto Driver to do their part. In the opinion of the committee 99 per cent of all accidents could be eliminated by respect for the rights of others and strict observance of road rules.

Another Employer in New York Staggers Hours

In an attempt to "stagger the peak" of subway traffic congestion, the Brooklyn Edison Company announced on Dec. 11 that it had reorganized the schedule of 1,000 employees in the office of its auditing department at the main office in Pearl Street, Brooklyn, so that they would arrive at work at 8:30 and 8:45 a.m. instead of 9 o'clock. If the system shows beneficial results it will be extended to all the 6,000 employees of the company. This is the third instance of a large business organization in New York City following the recommendation of the Transit Commission for improving transit traffic conditions pending the construction of new subways. The others are the Texas Company and Corn Products Refining Company.

Special Christmas Shoppers' Service Put On by Chicago Elevated

Special express service throughout the day for the convenience of Christmas shoppers was started on all of the divisions of the Chicago Elevated Railroads early in December. This service is designed to encourage use of the elevated during the shopping period and is made particularly convenient by operating these trains around the loop structure which embraces the heart of the shopping district.

Time-tables announcing the new service have been distributed at all elevated stations and have stimulated travel during the non-rush periods. The "Shoppers' Specials" are scheduled from 9:18 a.m. to 4:13 inbound and 9:55 to 4:50 outbound. They carry conspicuous signs at the front ends of the trains. On the backs of the time cards is printed an announcement of the new service and a list of the benefits to be derived by the public.

Safety Order Effective.—Accepting the proposition made voluntarily by the Rockford & Interurban Railway, designed as a safety measure to protect auto traffic at dangerous crossings, the Wisconsin Railroad Commission will enter an order effective at once requiring all interurban cars running between Beloit and Janesville to slow down to 5 miles an hour within 100 ft. of the town line bridge and after sun-down to stop at points where the tracks cross the adjoining concrete highway.

Fares Increased.—The Mississippi Valley Electric Company operating in Iowa City with both trolley and buses, recently increased its fare from 5 cents to 7 cents, according to J. O. Schulze, president. No opposition to the increase was entered by the city or by citizens.

More Truck Lines for D. U. R.—The Detroit United Railway has organized the Detroit United Railway Trucking Company to operate between Jackson and Sturgis, Mich. The truck line will serve as a feeder for the electric lines, connecting with them at Jackson. It will afford freight service to and from Detroit to a territory which has hitherto been difficult to reach.

Will Hear Increased Fare Request.—The State Railroad Commission of Florida, will hear in the City Council chamber of Jacksonville, on Dec. 17 the petition of the Jacksonville Traction Company for an increase in fares. The company now charges 7 cents for fares in the city, with concessions to school children. It does not ask for any fixed increase.

Additional Parlor Train Car in Service.—The Milwaukee Northern Railway placed in service recently an additional parlor train car between Sheboygan and Milwaukee, which is known as the "Sheboygan Limited." It will be a sister car to the one that is now running as the "Lake Shore Limited."

Fare Bills Appear at Washington.—Bills have again begun to appear in Congress directed against the local railways operating in the District of Columbia. A bill by Mr. McKellar, referred to the committee on the District of Columbia, would prohibit the local Public Utilities Commission from fixing rates of fare for the street railways of the District in excess of those that are stipulated in their charters. A bill introduced in the House would provide one-half fare for children riding on the street railways within the District of Columbia, "and for other purposes."

Veiled Prophet Brings Business.—All previous records for the United Railways, St. Louis, were broken on Oct. 2, the day of the visit of the Veiled Prophet to that city, when 1,007,615 revenue passengers were hauled, and the receipts totaled \$70,533. In addition there was 869 children's fares and 473,674 transfer passengers, the grand total being 1,482,158 passengers. A total of 1,465 cars was in service, twenty-eight more than were put into service on a similar occasion last year. There were no serious accidents on the record day. The previous record was set on Oct. 5, 1920, when the gross receipts were \$69,595. On that occasion a visit of the Veiled Prophet again brought out the record business.

Will Readjust Zones.—Despite the fact that the Virginia State Corporation Commission granted it permission to increase its revenue by 5 per cent on the Richmond-Petersburg Interurban line, General Manager John E. Harvell of the Richmond division of the Virginia Railway & Power Company stated recently that no increase in fares would go into effect, but that a readjustment of zones would be substituted. He said that in accordance with the orders of the commission the company would arrange to correct what the commission considered inequalities in the fare zones by making the mileage of the respective zones more uniform. Further, he stated that the company would simplify its commutation tickets by issuing only one form or one fifty-trip book. Heretofore the company issued four different kinds of tickets, and five different kinds of books. The changes go into effect Dec. 16.

Eight-Cent Fare Continued.—The Nebraska State Railway Commission has continued indefinitely the 8-cent fare on the lines of the Lincoln Traction Company and fixed a valuation of \$2,824,000 for the company's property. The valuation is about \$100,000 less than the total outstanding capitalization of the company.

Another Aid to Safety.—The Portland Railway, Light & Power Company, Portland, Ore., has placed safety islands, made of strong timbers, at various points along congested street railway lines, with the view of lessening traffic congestion at these points, and adding to the safety of the patrons of the lines it operates.

Personal Items

Barron Collier Subject of Magazine Sketch

Barron Collier is the subject of a personal sketch in a recent issue of the *National Magazine* which brings out forcefully the multifarious activities of the man. The work of Mr. Collier in the railway field is too well known to need reiteration here. Except to his intimates, however, it appears unlikely that all the various activities and interests of the man are known. Mr. Collier was born in Memphis, Tenn., in 1873, and there laid the foundation for the present nationally known Collier service. Some pertinent quotations from the article follow:

"One of the most graphic, dynamic charts of the business of the United States is the great panoramic display in the street cars containing the Collier advertisements. These cars run night and day. Think of it, 50,000 cars—and there are some advertisers who appear in these cars continuously.

"Barron Collier sees things quickly and acts decisively and works as hard in public service, without salary, as in his own business.

"A small list of his activities today would cover a page or two of 'Who's Who.'

"Mr. Collier owns, among other great properties, famous Luna Park, the most original place of amusement in the world.

"American to the core, he has been pointed out as a true type of one of the eminently successful men in this great age of business expansion primarily through the magic of advertising.

"The genius of Barron Collier as an executive is reflected in his talents as a toastmaster and entertainer.

"It is recognized, even in the swirl of busy activities in New York, that Barron Collier is about the busiest man in the metropolis. He seems to have a masterful grasp of what to do today to make things go on tomorrow."

In conclusion the writer says that all the multifarious Collier activities keep right on moving and developing under the magic and forceful leadership of Mr. Collier, who, after all is said and done, "is just a great, big human, full of the spirit of constructive helpfulness for his fellowmen."

C. A. Brooks Manager Again in Poughkeepsie

Charles A. Brooks has again been made manager of the Poughkeepsie City & Wappingers Falls Electric Railway, Poughkeepsie, N. Y., from which position he resigned about a year ago to go into the automobile business. He succeeds the late R. J. Morrisson. Mr. Brooks is well acquainted in the territory served by the company with which

he has again become identified. It was a little more than ten years ago that he entered its employ. Prior to that time he had been engaged in similar activity with the Third Avenue Railway, the South Shore Traction Company and on properties in the Central West.

F. R. Phillips Heads Pennsylvania Association

Official of Pittsburgh Railways Elected President at Meeting in Harrisburg on Dec. 4

F. R. Phillips, acting general manager of the Pittsburgh Railways, was elected president of the Pennsylvania Street Railway Association at the meeting held in Harrisburg on Dec. 4. Mr. Phillips was formerly superintendent of equipment of the Pittsburgh Railways. This position he held from 1910 until July, 1923, when he was appointed to succeed the late P. N. Jones. Before

F. R. Phillips

going to Pittsburgh Mr. Phillips was master mechanic of the Cleveland Railway. He entered the employ of that company in 1894 after leaving high school in Cleveland. When the Cleveland City Railway and the Cleveland Electric Railway were consolidated in 1903 as the Cleveland Electric Railway Mr. Phillips accepted the position of master mechanic of the Cincinnati, Newport & Covington Railway. Subsequently, he became chief engineer in charge of all but the transportation department of the Michigan United Railway, in Lansing. In 1906 Mr. Phillips entered the employ of the Ohio Brass Company, Mansfield, as designing engineer in charge of railway overhead work, and made a study for that company of the electric railway conditions of most of the large cities of the United States east of the Mississippi River. In July, 1908 he became master mechanic of the Cleveland Traction Company, in charge of buildings, shops and equipment. Mr. Phillips is the in-

ventor of a number of railway devices and has appeared before several railway commissions as an expert.

Mr. Phillips has been very active in the activities of the American Electric Railway Engineering Association, serving not only as a member of committees but as chairman of important committees. From 1916 to 1919 he was president of the Engineering Association. During 1922-1923 he served as a member of the committee on standards and also as a member of the special committee to study methods of voting on standards on the unit basis.

Obituary

Sir William Mackenzie

Sir William Mackenzie, one of Canada's empire builders, died in Toronto on Dec. 5. Sir William's name is inseparably linked with the building of both the Canadian Pacific and the Canadian Northern Railroads. He was one of the foremost Canadian promoters of electric railway, light and power companies. For thirty years he was head of the Toronto Railway.

He was also one of the promoters of utility enterprises in South America and had a large interest in the Brazilian Traction, Light & Power Company, which operates the tramway and power properties at São Paulo and Rio de Janeiro. Sir William was also interested in the Winnipeg Electric Railway and was a director of the Shawinigan Water & Power Company and the Canadian General Electric Company. He was president of the Monterey (Mexico) Railway, Light & Power Company for years. He was the senior partner of the well-known building firm of Mackenzie & Mann. With the changes wrought by the war Sir William was forced, as he grew older, to drop many of his responsibilities and the chief enterprises in Canada with which he had been concerned passed to others and the group of so-called Mackenzie financiers was dissolved. Sir William was born in Kirkfield, Ont., in 1849.

William V. Brumby, head of the publicity department of the United Railways, St. Louis, Mo., died in St. Louis, of pneumonia, on Dec. 7. As head of the publicity department of the railway for the last six years, Mr. Brumby was editor of the *United Railways Bulletin* and also *Trolleygrams*, published periodically by the company, to keep its patrons advised of company activities, etc. For a time he was also editor of *Know St. Louis*, a weekly journal dedicated to boosting St. Louis. Prior to his connection with the United Railways, Mr. Brumby was city editor of the *St. Louis Republic* and later was managing editor of the *St. Louis Star*. He was born in Atlanta, Ga., forty-seven years ago and had resided in St. Louis about sixteen years. He was one of St. Louis' best known newspaper men.

Reconstruction in Japan

**Rolling Stock in Tokio Is Being Replaced
Rapidly by the Local
Car Builders**

Although no accurate statistical figures are yet available concerning the extent of the damage done by the recent earthquake to the Japanese railways the report of American engineers who were in the country at that time gives a rough idea of the resulting destruction. In the municipality of Tokio there were formerly about 2,500 electric railway cars. The rolling stock was being added to at the rate of approximately 200 cars a year, of which two-thirds were double-truck cars and one-third single truck. It is said that upwards of 1,000 cars were destroyed by the earthquake and the fire which followed it. Orders have already been placed for 500 new cars to replace those demolished. It is understood that these orders have been given to Japanese firms who will build the equipment in Japan. Only the air-brake material is being purchased in the United States, and the car bodies, trucks, motors, etc., all will be made in Japan.

In the Yokohama district even less is known concerning the extent of the damage and subsequent plans for replacement. It is likely, however, that practically all of the rolling stock was destroyed.

ELECTRIFICATION WORK WILL PROBABLY CONTINUE

A great deal of damage was also done to the Imperial Government Railway and its substations. Orders for the replacement of much of this material have already been given and described on these pages in the previous issues. It is expected that no change will be made on account of the catastrophe in the plans to continue the electrification work.

Just what effect the earthquake will have on plans for subway construction in Tokio is problematical. Before the calamity occurred, three companies had been organized to build subways in that district. Plans for financing this work had been almost completed and actual construction would probably have commenced within a short time. The earthquake, however, has focussed a great deal of engineering attention on the comparative merits of various types of construction in Japan. It seems doubtful whether the subway plans will be carried out until a careful study has been made to show how different structural designs withstand such shocks. If it is found that the usual methods of subway construction are unsuitable for

conditions in Japan and that more expensive methods will have to be employed it may cause the curtailment or even the abandonment of the project.

Satisfactory Year for General Electric Predicted

According to latest available estimates, the General Electric Company at the end of the current year will have finished one of the most satisfactory years in its history with production at top speed and orders near to a record rate. The company should show at the end of the current year new orders booked well over \$300,000,000 and goods billed of about \$270,000,000. For the first half of the year new business reached the record volume of \$164,000,000, easily exceeding production. Subsequent orders declined some 20 per cent, but of late an upward trend has taken place. More than \$90,000,000 in unfilled orders will be carried into 1924 as compared with \$76,000,000 this year. Working capital will be somewhat reduced compared with the approximate \$180,000,000 at the close of 1922. Cash and government securities should amount to around \$80,000,000 at the end of 1923, a reduction of \$5,000,000 being explained by increased business and new plant construction. It is generally expected that the company's business will hold up at about the same level as this year. No recent large orders for railroad electrification have been placed, but several important railroads are contemplating electrification.

Price of Bituminous Coal Is Steady

No marked change has occurred in the price of bituminous coal at the mine during the past eight weeks. During this time the cost per ton has ranged between \$2.20 and \$2.25. Prior to that there was a steady decrease in price from an average of \$3.66 per ton during the first quarter of the year to \$2.66 for the second quarter and \$2.41 for the third quarter.

The present price level is below that of any recent year. In 1922 the average for the first three months was \$2.18 per ton but thereafter the price level was much higher, reaching the maximum of \$5.35 during the third quarter. In 1921 the price ranged between \$2.89 in the early part of the year and \$2.31 in the latter part of the year. The average price for the year 1920 was \$5.64 and for the year 1919 it was \$2.59. It is interesting to compare the present price of \$2.25 per ton with that of 1913, when bituminous coal at the mine cost \$1.23.

Railways Are Buying Larger Trolley Wire

A somewhat general tendency to use trolley wire of larger diameter has been noticed by the Bridgeport Brass Company in its recent orders from electric railways. In the past the No. 00 size has been the wire in greatest demand, although the No. 0000 size has been used to some extent by the street railway systems in the larger cities, and the No. 0 wire has been in some demand for the smaller properties. Lately, however, the number of orders for No. 000 wire has shown a marked increase. The smaller sizes are still being bought for replacement work where such sizes are the standard and for lines where the traffic is very light. But for ordinary conditions of city service many railways seem now to require the larger sizes.

U. S. Economic Prosperity Certain

Analyzing the situation in the United States in regard to its susceptibility to the influence of European misfortunes, it would seem that this country is so strongly buttressed by its natural advantages and so largely self-contained as an economic and financial unit that it is likely to be comparatively immune from the serious conditions in other countries. This is the opinion of F. H. Sisson, vice-president of the Guaranty Trust Company, delivered in an address on the economic outlook in Europe before the Economic Club of New York. In referring to the United States foreign trade, which has the most direct interest, he said that when the markets in Great Britain and on the Continent were in normal activity they absorbed between 60 to 70 per cent of American exports. In comparison with pre-war averages of exports to Europe the volume of the present trade is not diminished, while the value has increased materially. Considering the extremely adverse conditions that have existed these facts indicate that the United States is likely to retain a fairly satisfactory volume of trade with the Continent. It was his belief that American economic stability was a fact. To emphasize this he pointed to the almost unlimited production of raw materials, food and manufactures.

Metal, Coal and Material Prices

Metals—New York	Dec. 11, 1923
Copper, electrolytic, cents per lb.	13.15
Copper wire base, cents per lb.	15.75
Lead, cents per lb.	7.25
Zinc, cents per lb.	6.61
Tin, Straits, cents per lb.	46.375
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	\$4.50
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	1.70
Central, Ill., screenings, Chicago, net tons	1.45
Kansas screenings, Kansas City, net tons	2.00
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	\$6.65
Weatherproof wire base, N. Y., cents per lb.	17.00
Cement, Chicago net prices, without bags	\$2.10
Linseed oil (5-bbl. lots), N. Y., per gal.	\$0.94
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	11.25
Turpentine, (bbl. lots), N. Y., per gal.	\$0.93

Rolling Stock

Cleveland, Southwestern & Columbus Railway's twelve new lightweight interurban cars are equipped with four General Electric No. 265 35-hp. motors and single-end K-35 control with straight airbrake equipment and CP-27 compressors. The purchase was referred to in the *ELECTRIC RAILWAY JOURNAL*, issue of Nov. 17.

General Electric Company, Schenectady, N. Y., has announced some of the details of the order received by it from the city of Detroit for 100 four-motor car equipments for use in new cars to be operated by the Municipal Railways of that city. They will be installed on Peter Witt double-truck type cars, duplicates of 250 such cars now in use. The order calls for No. 265 motors with K-35 single-end control and CP-27 compressors. Fifty complete air brake equipments were also ordered.

Morris County Traction Company, Morristown, N. J., suffered the loss of a car shed at Dover on Dec. 9 as the result of a fire which destroyed the building, two safety cars, two 400 class steel cars and three 310 class semi-convertible. One steel car and one snow sweeper were slightly damaged. There was also some damage done to the sand drying house. A storeroom containing a part of the regular supplies was also destroyed. The total loss of the building and supplies amounted to approximately \$65,000, largely covered by insurance. Full service on the entire line was restored within three hours after the fire. No plans for replacement have been discussed.

Montreal & Southern Counties Railway, Montreal, Canada, ordered during 1923 one trailer for suburban use and one baggage car from the Ottawa Car Company.

Track and Line

Durham Public Service Company, Durham, N. C., during 1923 rebuilt 2,100 ft. of single track.

Lafayette Street Railway during 1923 built 1,500 ft. of track extension and rebuilt 832 ft.

Aurora, Elgin & Chicago Railroad, Fox River Division, rebuilt during 1923 3 miles of city track and $4\frac{1}{2}$ miles of interurban track.

Cincinnati Traction Company during 1923 built 5,764 ft. of track extension and rebuilt 24,254 ft.

El Paso Electric Railway, El Paso, Tex., will complete shortly the laying of new steel on the Sheldon "loop." The new steel cost \$70 a ton for ordinary and \$300 to \$400 a ton for special work. About \$19,000 was spent on special work steel.

Clinton, Davenport & Muscatine Railway, Davenport, Iowa, has received authority to lay a service track over

the combined tracks and right-of-way of the Burlington, Milwaukee and Davenport, Rock Island & Northwestern Railroads east of Davenport in order to ship in materials for the new \$12,000,000 superpower plant which the United Light & Railways company is erecting at that point. The Clinton, Davenport & Muscatine Railway is a subsidiary of the United Light.

Iowa City Electric Railway, Iowa City, Iowa, is making an extension on its North Dodge Street line.

Manitowoc & Northern Traction Company, Green Bay, Wis., during 1923 laid 1,110 ft. of new rail.

Eastern Wisconsin Electric Company, Oshkosh, Wis., has completed track repair and improvement work to the southern end of the north and south divisions of its system in Sheboygan.

Des Moines City Railway will be able to put into operation before Christmas the new Crocker Street line as far as Thirty-third Street.

New York, N. Y.—The Transit Commission has announced that a public hearing will be held on Dec. 21 at its office upon the draft form of contract for the construction of the crosstown subway. Plans are now practically completed for the section extending under Bedford Avenue from DeKalb Avenue to Keep Street. Commissioner Harkness stated that unless substantial changes were needed in the contract, the advertising for bids for this section should promptly follow the holding of the public hearing which is required by the rapid transit act. The advertisement for bids might be looked for possibly the latter part of this month, but surely the first part of January.

Power Houses, Shops and Buildings

Los Angeles Railway recently completed its Fifty-fourth Street substation building. It was built at a cost of approximately \$21,000, and will house machinery to improve the power facilities in the southwest section of the city.

Ottawa Electric Railway, Ottawa, Canada, is constructing a building adjoining its Albert Street carhouse which will contain a modern substation. The building will be 200 ft. long and 35 ft. wide. It will be of reinforced concrete, steel and brick construction and fire-proof throughout. A Westinghouse commutating pole synchronous rotary converter of 2,000-kva. capacity, six-phase alternating current, 600 volts direct current will be installed in the substation next month. This is one of the largest of its type in Canada. The 600 volts direct current will be carried in underground conduits in lead cable to the overhead trolley and feeder circuits and rail returns. The garage will be used for the storage of the com-

pany's motor cars and trucks and will also contain the linemen's quarters as well as workshop and stores for the line department.

Pacific Electric Railway, Los Angeles, announces work is to commence at once on two additional automatic substations to take care of increased traffic on its Long Beach, Newport Beach, Hollywood and Glendale lines, involving an estimated expenditure of \$245,000. The substation to take care of increased traffic on the company's Hollywood and Glendale lines will be erected at Second and Toluca Streets, Los Angeles, and will provide the increased power requirements for 100 new cars soon to be placed in service on the company's Hollywood lines. The second automatic substation is to be erected at North Long Beach, where traffic has rapidly increased due to the development of the Long Beach industrial district. During the past year more than \$800,000 has been expended by the company for increased power facilities.

Trade Note

Pantasote Company, Inc., New York, N. Y., has been changed from a partnership to a corporation. It is now known as the Pantasote Company, Inc.

New Advertising Literature

Westinghouse Electric & Manufacturing Company, East Pittsburgh, has issued three descriptive leaflets dealing with railway motors and electric locomotives. Leaflet Number 20,124 gives specifications for the Class B-1 50-ton locomotive, including ratings of hourly continuous and maximum capacity. The particular application of the locomotive is described and the details of its construction are enumerated. Leaflet Number 20,125 contains specifications for the No. 562 railway motor. It gives hourly and continuous capacity ratings, as well as a descriptive paragraph of the application of the motor and a table indicating the performance of a 50-ton locomotive equipped with four of these motors. The third, Leaflet Number 20,047, gives specifications for the Number 557 railway motor. This contains essentially the same information regarding the No. 557 motor as leaflet No. 20,125 regarding the No. 562 motor. The only difference is that the table on the first page of this publication is one to determine the suitability of the motor for a desired schedule.

Oakite Chemical Company, New York, N. Y., in its November-December issue of "News Service" has some interesting information with illustrations on how to clean cars. The company has also available a new sixteen-page booklet, entitled "Cleaning in Railroad and Car Shops," which will no doubt be of use to railway executives.

Remedial and Other Measures for Unraveling Traffic

EVERY city has a traffic problem these days. This fact is generally recognized by most every one, and there is unanimous agreement that something ought to be done about it some time by somebody. Ask any city official what he thinks about traffic congestion. "Isn't it awful," he will say. "But what can we do about it? The streets of this city were not laid out to meet the demands of modern conditions." As far as that goes, none of our cities was laid out to cope with such a situation as exists today.

But that does not mean that nothing can be done about it. There are several remedies available if any one has the courage to try them and to see them through. The trouble often is that as soon as a little opposition develops against any particular plan its proponents weaken and the plan is abandoned or the regulations are not enforced.

It is not necessary to solve the traffic problem for the next ten years at a single stroke in order to get some relief. One step at a time is enough. The thing is to make a beginning. An anti-parking regulation, a one-way street rule, the prohibition of left-hand turns—all these are helpful if enforced. Parking limited to thirty minutes or an hour has generally proved unsatisfactory, as this regulation is easily evaded though it does help some. Complete anti-parking in the business district is really necessary, however, to get any substantial relief. Even then the loading and unloading of trucks and wagons offers considerable obstruction to the free flow of traffic and it may be necessary to limit such use of the street space to the light traffic hours.

In all measures of traffic control the railways should make certain to have a voice, for their interests are those of a considerable proportion of the population. These interests extend beyond the streets on which cars are operated. Often a measure for expediting traffic on one street, or at least with that as its object, may seriously impede vehicular movement on another street.

An example of this is the block signal system installed recently on Michigan Avenue, Chicago. On that boulevard it has brought about a more orderly movement of automobiles and has no doubt contributed to safety. But it has slowed up the speed of vehicles along Michigan Avenue so that many drivers leave the boulevard and take to Wabash Avenue and State Street, the two adjacent parallel streets, as they can make better time. It is said that if you ask a driver of the Yellow Cab Company—the concern which paid for the installation of the signals in Chicago—to get you somewhere quickly, he avoids Michigan Avenue. It is also amusing gossip in Chicago that the signals so slowed up traffic that the Yellow Cab Company got back the cost of the traffic towers the first day they were in operation. Of course this is not true, for the taxi

meters run up faster on a distance basis than on a time basis if they have free running, and faster running was what was hoped for as the result of installing the towers.

This shifting of traffic to Wabash Avenue and State Street is now seriously interfering with the movement of street cars, particularly on Wabash, which is an exceptionally heavy rail route. This illustrates how vitally interested the railway company is in all traffic control measures. It is as competent as any one to judge of the suitableness of a proposed measure and it should be prepared to take the lead in a constructive effort to improve the situation generally.

A Constructive Talk to the Industry

RECURRING all through the interview with the new president of the American Electric Railway Association, published in this issue, are suggestions urging improvement of electric railway facilities and operation, and better methods of selling the service. Modernize and merchandise—these are his principal messages. They represent the two major opportunities of the electric lines today. Both are closely coupled, however, with the matter of building good will, which seems ever to be to the forefront in the mind of Mr. Budd in any consideration.

The railway that is doing things, he has found, is the one whose business is growing. That is borne out by experience the country over. The road that has "gone to seed" loses all attraction to people, who then ride only as necessity requires. On the other hand, with progressiveness and a true spirit of service in evidence, a railway can create new riding; that is, more rides per capita.

The interviewer's admonitions, in a plea for old-time enthusiasm in embracing and developing new kinds of service and new kinds of traffic, are well taken with respect to the spirit of many managements, though it has been encouraging to observe that there has been a notable change in some quarters during the past year. No doubt this more active interest will spread rapidly this next year and beyond as more and more roads show black figures on their balance sheets. Particularly is this true in view of the impetus that Mr. Budd's administration will give to these matters. It is to be regretted that there has not been greater courage and more aggressiveness in utilizing the improvements which have become available. These would have contributed materially to an earlier return of prosperity to roads that are still struggling along in red ink. As a matter of fact, the most readily available means of placing most roads on a satisfactory earnings basis is the extensive adoption of such modern practices as one-man operation, use of light-weight cars, automatic substations, and other economy measures.

Signs Should Explain Irregular Operation of Cars

FEW things annoy the average man more after waiting for a street car than to have the first one go by him without stopping. This annoyance is mitigated but little even when the destination sign is marked "Special" or "No Passengers." That there are sufficient other cars on the street to carry the passengers has no weight with the car-riding public. Neither does the contention that the following car will get the passenger to his destination almost as quickly as the first one would have. The mere fact that a car goes by him without stopping while he is waiting for transportation is cause enough for ill temper. This the railway should spare no reasonable pains to avoid.

There are several reasons why it may not be desirable to have a car carry passengers on a particular trip, as any transportation man knows. Frequently, however, investigation will show that more trips of this sort are run than necessity demands. A defective car that is bound for the carhouse should carry a sign with some such wording as "Car out of order" rather than a "special" sign, which carries vague meaning if any to the man on the street corner.

Cars pulling out of the carhouse or going back to it frequently can carry passengers to advantage on the way to or from their regular routes. But this calls for the use of some sign wording more meaningful than "Carhouse," "Barn," "House," etc. To have a sign of universal application would make this wording difficult, but in so far as cars are operated continuously from one carhouse, a single sign for them can be given some such wording as "Irving Carhouse via 10th St."

Even if it is the policy of the management to carry passengers on irregularly operated cars where possible, much follow-up work is necessary to see that the orders in this respect are enforced.

Safety Stops for the Railway or Common Sense for the Motorist?

AN IMPORTANT question is raised by the action of the New York State Bureau of Highways in asking that the Public Service Commission compel the cars of the Hudson Valley Railway to come to a full stop before crossing one of the state highways. The reason given for this request is that the automobiles crossing the intersection daily outnumber the interurban cars.

If no better argument than this can be advanced in behalf of the proposal, it hardly merits very serious consideration. The disastrous wreck on Dec. 9 of the Twentieth Century Limited, which resulted indirectly from an accident at another grade crossing in New York State, serves to emphasize the meaning of such a proposal as that made by the Highway Bureau. How ridiculous it would be to propose that one of the crack trains of the country be required to stop at every important grade crossing. That of course is the *reductio ad absurdum* of the bureau's proposal, but it falls within the same principle that the bureau would apply to the Hudson Valley Railway. Obviously the question is not a matter of the relative number of vehicles.

Grave doubts may well exist concerning the ultimate benefit in the direction of public safety which would follow the adoption of the policy sponsored by the New York State Highway Bureau. If one highway crossing is made a safety stop, why not every highway crossing? This would result in a situation intolerable and

most unjust to railway passengers, and dangerous even for the motorists, for it would tend to make them more careless than at present. Their best safeguard is in their own caution. A special situation may exist to make desirable a safety stop at a particular point, but the mere fact that automobiles are more numerous than the electric railway cars is not a sufficient reason. This is said of course on the assumption that the railway has used every reasonable means of safeguarding its operation, which it must do in self-preservation.

It is believed the highway bureaus would do better to take steps to impress upon motorists the importance of observing the rudimentary precautions before crossing railroad tracks, either steam or electric. Coupled with some form of examination and registration of all drivers to eliminate those obviously unfit, the annual loss of life and limb due to the grade crossing could be reduced to a small fraction of what it is today, and accidents of the character of that of Dec. 9 could be eliminated entirely. Not only would this apply to grade crossing accidents, but the idea of greater care should reduce traffic accidents of all types.

New Type Committee Activity May Speed Modernization

THE recently formed committees of the American Electric Railway Association on city operation and interurban operation represent a distinct innovation in the methods of that body. In the past committees have had quite definite assignments, and have held strictly to their tasks. Here, however, are two committees whose function is to expedite modernization of railway operation by investigating first hand the advance practices of various companies and passing these on as suggestions to other companies. The field is so broad that only the most general instructions can be given in advance.

In general, the scheme of these committees is to have the entire country divided into seven regions, with a vice-chairman of each committee in each region. These men, who are really the key men of the entire plan, are to devote a portion of their time to visit and investigate the properties in their respective territories, with a view toward finding out what each property excels in that is applicable to other properties. This is to apply not only to the physical elements, but also to organization, publicity and public relations, and financing.

The possibilities from the work of these committees is very great indeed, the measure of accomplishment depending very largely on the interest, intelligence and time devoted to the work by the vice-chairmen. If they succeed in fulfilling the ideas of President Budd in creating the plan, they will appreciably speed up the modernization program throughout the industry.

There is no question that there is plenty of room for improvement in this direction. One trouble with the railways is their procrastination in adopting modern methods, even though it may be shown conclusively that they are advantageous. These committees can commend or criticize existing practices and thus perhaps stimulate managements to greater activity in putting their houses in order. But if the suggestions of the committees accomplish nothing in this direction, one thing is certain—the traveling vice-chairmen will themselves get a lot of good out of their work by virtue of taking time off their own jobs to study the practices and facilities of other companies.

Modernize and Merchandize

An interview with
Britton I. Budd

President
American Electric Railway Association

By **Harry L. Brown**
Editor Electric Railway Journal

IF ONE wanted to follow the charted course for published interviews, Britton I. Budd, the new president of the American Electric Railway Association, would make an excellent subject. His personality and position would lend themselves to a colorful exposition of the traits and ideas which have enabled this self-made man to attain such great heights of responsibility. For Mr. Budd is as good a fellow and as interesting and capable a man, and has been entrusted with such responsibilities as would delight the literary genius looking for a story—a human interest story of a big man.

But further than to remind you that Mr. Budd is president of the Chicago, North Shore & Milwaukee Railroad, the Chicago Elevated Railroads and the Public Service Company of Northern Illinois, it is preferred here to omit all reference to those things which would reveal the character of the man and his pre-eminent fitness for leadership, appealing as they are, and devote the entire available space to the unadorned statements which express the views of the head of the electric railway industry on many of the more important problems confronting the railways today.

Suffice it to say that something of the personality of Mr. Budd, and some idea of the reasons why he occupies so prominent a position in the field, will be better appreciated after a reading of what follows. Submitting to my questioning, he has here contributed his views on the bus, on the general philosophy of selling transportation, on personnel training, modernizing equipment, especially interurban equipment, on publicity and advertising, on future rapid transit development, freight handling, results of one-man operation of modern cars, and so on.

The bus seems to be about the uppermost question in every electric railway man's mind these days, so I started in on that subject. The record of the interview follows:

THE BUS NOT A PROBLEM BUT A USEFUL TOOL

QUESTION: Do you consider that the bus is about the biggest new national problem confronting the electric railway industry?

MR. BUDD: I do not think that I would call it a problem. It seems to me it is an added feature of transportation that is going to be utilized by the electric railways.

QUESTION: To what extent do you think the industry will extend its present bus operations? Will it buy a good many more buses in the near future than it has in the past?

MR. BUDD: I think that the electric railways will find

Britton I. Budd

it to their advantage to use buses in a good many different fields. Of course, the amount of bus operation is going to increase very largely. The usefulness of the bus has been demonstrated and its use extended in so many different ways that I believe we can look for a very large increase in the number of passengers transported by means of buses. Furthermore, this is a development of the immediate future. It is right here at the moment.

QUESTION: Do you think the railways ought to go into the bus field with a downtown service, or merely connect up with existing rail lines at outside points?

MR. BUDD: It depends entirely upon the character of the city. If there are certain sections of the city where the territory is able to support it, there is no reason why there should not be a bus service delivering the people to the heart of the city, predicated of course on the streets having sufficient capacity and the bus service not contributing seriously to congestion.

QUESTION: Even though such operation might be competitive to a certain extent with existing rail lines?

MR. BUDD: Well, that of course is something that cannot be answered in an off-hand way. I can conceive that in certain areas of a city which might not be conveniently served by an electric railway a bus service could be utilized to good advantage.

QUESTION: To what extent do you think the motor bus can actually be made a monopoly? We speak of maintaining the monopoly of transportation, co-ordinating the service and keeping the bus in the hands of the railway people, but is the bus actually subject to monopoly? In other words, because of the small investment required to get into the bus business, by individuals, can it actually be made a monopoly?

MR. BUDD: It should be made a monopoly, because if it is not, it will be a most unprofitable thing to the individuals or companies who operate it, and the service will be unsatisfactory to the people. It should be co-ordinated with the other transportation facilities of the city and protected from competition. It would only produce chaos to have a lot of bus companies operating in one city.

QUESTION: In other words, it is partly a matter of protecting the bus against itself as well as the railway against the bus?

MR. BUDD: Absolutely. That was illustrated in London, where the Underground people have 5,600 buses. Through some mistaken notion on the part of the Parliament, a great many others were allowed to go into the bus business, and the inroads that they are making in taking the cream off certain routes have presented a serious problem to the big bus company and made what was a profitable venture almost a doubtful one. In other words, they are jeopardizing the main service supplied the people.

QUESTION: What further steps can be taken to emphasize the public need for co-ordinating all means of transportation and utilizing the existing traction corporations for the purpose?

MR. BUDD: Of course, I have no doubt that co-ordination of all transportation in the community would be the best from the standpoint of the cost to the rider, and it would also insure the municipality of meeting the demand for any kind of service, or any extension of service, because this one agency would be able to furnish whatever transportation was needed at any point in the community.

QUESTION: Then, what is your idea of the position the bus will occupy in transportation. Is the field for it largely in the outlying sections of cities and in inter-urban territory or in the congested sections of cities too?

MR. BUDD: Well, in the smaller communities it may be that bus service, assuming that a community has no service of any kind, will meet the needs and help the growth. Beyond this, necessarily the city ought to have electric railway service, and there the extensions that are needed from time to time can be first instituted by the bus until the territory will support the electric railway. There can also be feeder lines, or lines of a supplemental character where electric railway service will possibly never be supported. A bus can be operated at certain times of the day to serve certain needs and discontinued the balance of the day. It is flexible for serving a small number of people with infrequent service.

QUESTION: Is any railway company making any money on bus operation?

MR. BUDD: Why, I think there are instances where the bus is profitably operated by an electric railway. There are a good many considerations that enter into the matter, so that it is not to be judged purely on the basis of whether it is profitable. Take the case of a feeder to an electric railway, and it is pretty difficult to segregate the income that the railway will get for its portion of the haul and the business that is delivered to it which it probably would not otherwise get if it were not for the bus. Then there is the other feature, where buses are used for pioneer work. If the electric railway had to invest in tracks and facilities and wait for the territory to build up, that might be a very

considerable factor. So, as I look at it, bus operation may or may not be profitable, but where the electric railway has need of it, it is a useful tool. It serves certain purposes due to the modern changed ideas of the people and also due to the fact that practically all communities in the country territory adjacent to cities are changing.

People are spreading out. They are getting farther and farther away from transportation. They do not regard it as necessary to be right close to existing transportation any more. The bus comes in to fill a need in connection with these new living habits. I know that is going on all around Chicago. People are locating out in the country considerable distances away from the existing means of transportation in locations that would not have been thought of five or ten years ago. Now, there will be no possibility of serving those people with a railroad, and yet they can be served with a bus and at such times and to such an extent as may be necessary. But as a general answer to your question, as a rule the bus operation by itself has probably not been profitable.

QUESTION: Do you think we are moving in the right direction by setting up the general policy of charging the same rate of fare on the bus that we do on the railway and issuing free transfers between the two?

MR. BUDD: No, I think that the bus operation should be made as nearly self-supporting as it can be. There may be exceptions to that rule, as for example where an extension is contemplated on the end of a railway line, and preparatory to that a bus line is put on. The company might be able to afford that bus service and give a transfer, which would be perfectly all right.

QUESTION: I would like to have your ideas about the advisability of publishing bus matter in *ELECTRIC RAILWAY JOURNAL*. Do you think we would be aiding the electric railway industry more now by discussing railway operation of buses in articles in the *JOURNAL*?

MR. BUDD: I have thought of that a good deal, and I am inclined to think that the time is getting around to the point where the *ELECTRIC RAILWAY JOURNAL* could incorporate bus features as part of the *JOURNAL*. I do not know whether the time is here now or whether it should be done in six months or nine months. But as soon as the electric railway industry gets to the point—and I think it has reached that point now—where it will utilize the bus to the extent that seems advisable and necessary, then the *JOURNAL* would be helping along the idea that it is an accepted practice of electric railways to utilize the bus. And it will be in the best interests of the industry when that idea is generally accepted. It was too bad it was not accepted, in my opinion, two or three years ago. I think it would have saved a lot of grief and trouble that we may be a long time in remedying.

THE OUTLOOK FOR THE CITY RAILWAY

QUESTION: What, in general, do you think is the future of the street railways with regard to increase or decrease of traffic?

MR. BUDD: I think the street railways will continue always to handle the mass of the people, and the increase of traffic will go on the same as in the past. I do not think there will be any effect upon the street railways by any bus operation. The street railways of this country, however, have got to deal with vehicular inter-

ference in congested portions of cities through some means of rapid transit or underground transit. That is not altogether their problem. It is the problem of the cities. The vehicular congestion due to the enormous increase in the number of automobiles is fast approaching the point where there is insufficient street capacity. Space off the streets has got to be found for parking these machines. The electric railway will have to find some solution of present congestion in order to make reasonable speed. Whether that will be done underground or overhead will depend on the community. It ought to be treated in such a manner that the expense will be borne by all the city, not alone by the company or the car rider, because the necessity for subway or elevated is simply a development that has come with modern conditions. The only other way to get more street capacity would be by materially widening the streets. This could be done, probably, in some communities, and in others it could not. But in any case it should not be done at the expense of the railway company.

QUESTION: Is there any prospect of getting some measure of rapid transit service with street cars by giving them the right-of-way on the main routes, at least during the rush hours, and thus avoid the heavy investment required in subways?

MR. BUDD: That may be a possibility if there are enough entrances and exits to a business district so that some streets could be used exclusively for railway traffic. But in most cities, a good deal of the business is done through the medium of people driving around in automobiles, and to exclude them from certain streets would make it an impractical proposition because it would require people desiring to shop on that particular street to walk. Even then it might possibly be worked out.

QUESTION: You are convinced then, I take it, that there really is not much hope of having rapid transit systems unless the public does come in for a share in the investment?

MR. BUDD: No, because there is an enormous outlay, and there is no good reason why the property owners affected should not bear that expense. Due to the growth of motor vehicles and the height of buildings, the street capacity is no longer able to accommodate business. Consequently it becomes necessary really to build another street underground or overhead, and that is in the interests of the city; it is in the interests of facilitating business. If things go on indefinitely, nobody will be able to transact business. An automobile won't even be able to get to a place. A truck won't be able to deliver goods or take goods away. And the time element will be such that business can only be conducted at a tremendous loss.

It will have the effect of driving business out into the less congested sections. There is no doubt but that will be one of the developments to come in the modern city. There are a lot of business concerns now doing business in the heart of the city where there is no need of it at all. They can just as well be 3 or 4 or 5 miles out. There is talk here in Chicago now of certain large concerns like insurance companies, moving out of the Loop district. Their business is largely conducted by mail. They have thousands of employees.

They can get them right around in the neighborhood that they live in and get away from all of the congestion.

But still with all these developments there will be need of getting more street capacity. If it can be obtained by new streets, that is one way; if it can be obtained by wider streets, that is another way; if it can't be obtained by either one of these means, why then it is a question of going underground or over head.

QUESTION: Is there any possibility of impressing the public with the necessity of so regulating vehicular traffic as to give the street railways more freedom in their operation?

MR. BUDD: A great deal can be done that way, by eliminating parking and by proper traffic regulations and by diverting as much traffic as possible from the streets on which the railway operates. There is no reason why that should not be done.

QUESTION: Mr. Budd, what do you think of the weekly

pass as a seller of service and a creator of good will?

MR. BUDD: I think it is a fine, equitable means of affording low cost transportation to people who frequently use it. It is the only process that I know of in a city where with a fixed rate of fare you can give a wholesale rate for a wholesale use. That use is spread out; it is not confined to the rush hours, so it is not inequitable. There is no unfairness toward the other car riders by reason of it. It encourages a more frequent and greater use of railway service. By encouraging the use of transportation you are increasing the good will. Transportation is like anything else; it is a habit and it can be cultivated. We think the pass makes that possible.

In addition, it allows the interchange of business and occupation all over the community. It does not confine it to any one particular spot and therefore it is a good thing for the merchants. It is a good thing for the different parts of the community to have a free and easy means of intercommunication. It also allows merchants in one part of the city to feel that the people in another part of the city are easily accessible to them. The same way with entertainment houses, theaters, restaurants, stores, lodges—any kind of community activity that depends upon the attendance of people is

New Traffic Can Be Created

I BELIEVE that it is possible to create new traffic. We fellows in the transportation game are very prone to think that the traffic available is only that where the rider is required to travel. We think when business is increasing that it must be due to the fact that everybody is employed, that the weather is fine, and all that. But back of all that is the question of whether the service is encouraging travel. I tell you, you can just as well increase the quantity of travel as you can increase the sale of some class of goods by proper merchandising and proper standards.

benefited by the use of the pass. Therefore, the pass, making all this more readily possible, reacts favorably on the transportation company, and the people and stores and others who are benefited feel that the railway company is performing a very useful service in the community. Therefore, it engenders good will.

QUESTION: Are you satisfied it brings more money to the railway company?

MR. BUDD: I am. From my experience with the pass as applied here, I regard it as a very satisfactory method of selling transportation. We have no criticism to make of it at all. It has brought a great many

out, maybe in the evening to visit friends, maybe take them shopping, maybe to go to church, maybe to go to the parks and amusement places. Well, the parents of large families find it burdensome to take the children. They probably would not be very happy if they had to leave them at home on account of the expense of taking them along. Therefore, the low fare serves a very useful purpose there and makes friends. I do not know of any class of business that can be increased in a more substantial manner than in making it possible for the children to use transportation, and at the same time it means good will.

Now, on the North Shore Line, although we have increased our rate of fare a number of times, each time I have held firm on this question of the rate for school children. And I believe that this was one of the things that did much initially to make the people in that territory feel that we are the right sort and have the right ideas; whereas if the rate of fare for those children had been raised, we probably would have had every parent up in arms against us.

What does it mean to us? It is a little service that you perform of an auxiliary character compared to your regular services—the handling of those children at a small rate of fare and having all your crews give them special attention. Why, one of our trains coming down here in the morning is like a party, the conductors and the motormen looking after the children and calling them by name. Nothing is to be gained by the thought that you cannot carry school children except at a certain rate of fare. Whatever you obtain in income by an increase would be more than offset by ill will.

SEES EQUIPMENT DEVELOPMENT COMING

QUESTION: Mr. Budd, what can the manufacturers and the railways do to promote more rapid development of electric propulsion apparatus for railway service? I know that is a subject you are interested in.

MR. BUDD: Well, they probably could do a great deal, and they are doing a great deal. With the more prosperous condition of the electric railways I expect to see a great many developments in the next few years, not only in improved apparatus, more efficient and more economical apparatus, but also I expect to see marked improvements in car design. My own thought is that the electric railways, during the times of decreasing income and increasing expenses in the past years, have followed strictly a program of what was absolutely necessary to perform the service, eliminating everything that was in the nature of luxury or refinement. There they made an error, and a very considerable error, because the American people, all said and done, will not be satisfied with anything but the best of service. They are willing to be liberal where that service satisfies them, and they like luxury. Standards of living and the standards of thought have changed a great deal in the last five or six years and transportation ought to be changing with them. Consequently I think that our track ought to be better maintained, our speed ought to be increased where it is possible, and it is possible in most cases—it ought to be materially increased, and the exterior of our cars ought to be made attractive and the interior ought to be made more luxurious. All this will tend to sell the thing that we have to sell, and that is transportation.

QUESTION: You are thinking of city as well as interurban service in that, are you not?

MR. BUDD: Everything. To my mind we ought

Rail Transportation Should Be Up to New Standards

THE American people, all said and done, will not be satisfied with anything but the best of service. They are willing to be liberal where that service satisfies them, and they like luxury. Standards of living have changed a great deal in the last five or six years and transportation ought to be changing with them. Consequently, I think that our track ought to be better maintained, our speed ought to be materially increased, and the exterior of our cars ought to be made attractive and the interior more luxurious. All this will tend to sell the thing that we have to sell, and that is transportation.

people to use the service who might otherwise be using automobiles, which would cost them a great deal more money and a great deal more time.

The great problem of transportation in a large city is continually to increase the volume of business so that the unit cost can be reduced, and anything that tends to increase the riding habit will ultimately tend to lower the cost of performing the service. If you can lower the cost of the service and make it attractive, you can increase the volume, and volume is the desirable thing, because it means the greatest convenience to the public.

LOW FARE FOR SCHOOL CHILDREN BUILDS GOOD WILL

Just another thing in connection with that question of the rate of fare. I believe that the rate of fare for school children should be made just as low as it is possible to make it, to encourage the use of railway service by the young people. This should be done not only as a matter of performing a useful service to the community, but also to cultivate the good will of the parents. They will intrust their children to the railway company and feel that they are safely and carefully looked after by the crews.

Another element is that the good will and satisfaction of people in the communities is increased where they have large families. They want to take those children

to be striving for innovations, changes, rather than simply sticking to something that seems to be an accepted practice, because whether we realize it or not, all our ideas have changed. Ten or twelve miles an hour won't satisfy us any more. We are irritated at the loss of time. The ordinary luxuries in travel that we thought were all right a few years ago are no longer acceptable to us.

We look with more or less scorn upon a tarnished or old fashioned car on the better through trains. We turn up our nose almost instantly. In a measure that is the reaction that the average rider gets when he sees the same stuff day in and day out, and there is never any change and never any innovation. So I think it is something that we can do constantly—strive for something in the way of improvements. The American people like to see changes. They like to see new ideas, and if they do see them, why they are keenly interested.

It has been a revelation to me on the North Shore to see what a lot of interest people really do take. Everything we do is of just as much interest to the people as to us. They talk about it, are enthusiastic about it, and act as though they themselves were personally interested. So monotony in any kind of business, I don't care what it is, is bad. The merchant who has the same window display every day in the year is going to lose your interest. You are going to go to the fellow who is giving you something in the way of a change, setting up new goods in the window, not the same old stuff. You have seen that and you have tried it and you know all about it, and there is no thrill in it. But the merchant who is changing his windows all the time is going to attract your business. The business of transportation is like anything else. People are not forced to use our method of transportation.

There are many instances that will illustrate that. We put observation cars on the North Shore. There is a very rich man who had never ridden on our line, though he had often seen it as he traveled up and down along side of it. But he hopped on one of those observation cars one day and rode to Lake Forest, and he said: "That is something like it. I have been hearing all these people talking about this electric road. I never could see anything in it, but now you have got something that appeals to me. I am for the electric and after this I am going to use it."

Well, now, you might question whether there is any money in those observation cars. I do not think there is. There are only twenty-six seats in them and we get fifty cents a seat—that is, \$13 if we get them all filled, as against a coach with fifty-two passengers in it. You cannot figure out any money in that. But how much collateral good and how much drawing power has it? It is advertising our service and encouraging the use of it, the frequent use of it—so much so that we have ordered some more of these cars. We will have six trips out of each city every day with observation cars on the trains. If those are well patronized we will put on three more. If it is necessary in order to attract a certain amount of business to have an accommodation of that kind, why not furnish it? It is this volume from all sources that creates the business.

So, on this general idea of equipment, it seems to me we ought to tend toward more comfort, and depart from the plan we have had of just simply using whatever will last the longest, like wooden or slat seats, cane seats, and a certain type of frame, whether it is comfortable or uncomfortable, as long as it is a seat.

We know in the automobile business that a family will buy first a machine at \$1,000 and then, because they want something more comfortable, something with a little more style to it, they will buy one for \$2,400 and they will feel it is money well invested, and it tends to make life a little more pleasant and a little more worth living. Why isn't the same thing true of the railroad problem?

Take the example on the Elevated here of our getting a paint color for the exterior of the cars that would, when dirty, be just the color of dirt. That was the reason for our selecting that color years ago as it would require less cleaning. We totally excluded all

Get Something New— Monotony Is Bad

TO my mind we ought to be striving for innovations, changes, rather than simply sticking to something that seems to be an accepted practice; because, whether we realize it or not, all our ideas have changed. Ten or twelve miles an hour won't satisfy us any more. Ordinary luxuries in travel, all right a few years ago, are no longer acceptable.

It has been a revelation to me on the North Shore Line to see what a lot of interest people really do take. Everything we do up there is of just as much interest to the people as to us. They talk about it, are enthusiastic about it, and they act as though they themselves were personally interested. So monotony in any kind of business, I don't care what it is, is bad.

idea of pleasing appearance, of getting a good reaction from our passengers, having them say, "Well, there is a nice looking vehicle. I am glad to ride in it." The only consideration was that it would cost less to clean that car and that the paint of that color being near dirt would last the longest without repainting.

Well, now that was undoubtedly the theory that a great many of us were working on, and that is a back number. It won't do. We have got to get the railway fellows to get away from that idea. We want speed—good looking exteriors and comfortable interiors, with speed. That is what the people want nowadays.

FINANCING NEW WORK

QUESTION: In the matter of making improvements that show substantial economies or offer possibilities for increased earnings, isn't there usually some way to finance that work if the railway has the will to do it? We hear a good many railway companies, especially interurban railways, which recognize there are many directions in which they can economize and improve, always answer with the same thought—that they haven't any money.

MR. BUDD: Well, that is a pretty hard question to answer, but where they have obsolete equipment and equipment that is unsuited to modern conditions, heavy,

unnecessarily large, extravagant in power consumption, extravagant in maintenance, still may have years of life, there ought to be some means found of replacing that equipment with modern equipment; if not all at once, gradually. The economies in many cases through the purchase of that new equipment would be so great that those companies ought to be able to buy it even if they did not have the money, because it could be easily shown to the manufacturer or banker that within a very few years the cost of it could be paid in lower operating expenses. Some of these interurban companies that are operating these great battleships, due to some preconceived notion that simply because it happened to be an interurban it had to be a car with a certain contour, a certain formidable appearance and weight and so forth, regardless of the service, all that class of cars the railway companies could well afford immediately to replace. I think they would find they would have the co-operation of the manufacturers in doing so.

I know of a case where equipment of that type could be replaced with modern equipment and the entire cost of it saved in operating expenses in five years. Some of this stuff we are now running is ridiculous.

QUESTION: Between car trust certificates, and employee and customer stock ownership, then, there ought to be some way to finance good improvements, don't you think?

MR. BUDD: Surely.

QUESTION: What are your ideas about this whole question of valuation and capitalization and relations between the two, and what ought to be done with the financial structure of many railways?

MR. BUDD: Well, I do not know. Of course it is very easy to say that the total securities should not exceed the value of the physical property. That is an ideal condition; and a further ideal condition to be aimed at is that the bonded debt should constitute less than 50 per cent of the total capitalization.

Some of these companies probably will have to be re-organized and their financial structure recast. Where that is possible it will of course put them on a much sounder financial basis, and when that is generally accomplished, will greatly improve credit and public relations.

QUESTION: On this matter of public relations and publicity, I wonder if you have any ideas of new ways to build sound public relations that might be tried by the utilities. What more can we do than at present?

MR. BUDD: What more can we do? Well, if every company was doing its utmost to give the best service it was capable of and its employees were actuated by an earnest desire to serve and to make friends, and if the facts and information about the company and its service and its problems were being disseminated continually year in and year out, if every company was liberally advertising year in and year out, if it was talking its problems before public bodies year in and year out, if it was seeing to it that every one, including the children in the schools, was informed, then I would say that maybe there was nothing more to do, except to do all that every year, year in and year out. But there are a lot of companies that are not doing a thing.

QUESTION: Then, Mr. Budd, you do not think there is any such thing as overdoing publicity, railroad publicity?

MR. BUDD: No, not if it is intelligently done. I do not think you can do too much of it, and I do not think that you can be too liberal in your appropriations for

doing it, within reason, because an uninformed public not only reacts badly upon the credit and the business of the company, but it also has its reaction upon any constituted authorities, the commissions, the juries that try personal injury cases, the municipal authorities. These authorities may want to do the fair thing, but with an unfriendly atmosphere all around them, due to a lack of information, they are either neutral or their hands are tied for they reflect that unfriendly atmosphere, so that your whole structure depends upon it. And if you have to get capital from the people through some customer ownership plan, why your very life depends upon it. You cannot exist, because people who are not informed and are unfriendly certainly will not lend you their money to put into new equipment and plant; that is self-evident.

You have also got to have your employees informed and familiar with the company's affairs or they cannot possibly talk intelligently to the people they meet or their neighbors, and they cannot defend the company even though they may wish to. To inform your employees you must have your supervisory force informed.

QUESTION: Quite a number of railway men have asked me how much a railway ought to put aside as its appropriation for publicity work.

MR. BUDD: Well, generally speaking, I should say that for publicity and advertising they could safely put aside 1 per cent of their gross as a minimum.

RAILWAY FIELD AS OPPORTUNITY FOR YOUNG MEN

QUESTION: Mr. Budd, what can you say as to the opportunity the transportation industry now offers to young college men?

MR. BUDD: I think it offers a great opportunity. The problems of transportation in the big cities and in the country are, if anything, more interesting and call for greater skill and initiative than in the past. And with modern engineering and modern methods, these problems will test the mettle of our college men and afford them great opportunities, not only in connection with the electric railways as they exist and as they will develop, but in the extensive rapid transit development that is bound to come.

Rapid transit development during the next few years is going to be a very great factor because the trend of the population is toward the city, and that means, as the cities increase in area, greater speed will have to be reached in order to reduce the time involved in travel. So that there will be an intense development of rapid transit facilities in all large communities as main arteries to transport the people very considerable distances in a short space of time at a high speed. In addition to that, I believe that all of the steam railroads as they now exist in these big communities will be electrified and that to all intents and purposes they will become part of the rapid transit systems of the great cities. They may even be interconnected or coordinated with the local transportation systems in the communities.

Finally, all these various means of transportation, whatever they may be, steam railroads, rapid transit lines, street railway lines and bus lines, will be utilized to their fullest possible extent for the purpose of serving the people, because transportation in these areas of tremendous population is as essential as the sewer system, as the water system, as the power system. With rights-of-way difficult to obtain, costly, if not

prohibitive, why the utilization of all existing means of transportation will have to be employed for the common purpose of serving the people with the necessary means of intercommunication. Transportation is going to be more and more a development and a problem due to this tremendous growth of cities, and therefore there ought to be opportunity for advancement and success of young men entering the business far greater than in the more or less pioneering days of the industry.

QUESTION: There seems to be a pretty well defined feeling among undergraduate student bodies that the opportunity to make money in the transportation field is less than in other lines of endeavor. What is the answer to that?

MR. BUDD: Of course, in the electric railway field it is probably true that there is usually less opportunity for individual ownership or part ownership of some railway enterprise, such as there might have been twenty or twenty-five years ago in the days of construction and promotion, where it might be possible for a young man either to have built or become a part owner in a property or some enterprise, but on the other hand those were very small undertakings. Today, these great enterprises must have the more skilled men in the technical and administrative ends, and there will always be a demand for them, and there will be liberal and generous salaries in order to attract those men who can meet these problems of engineering and management. But I believe that if, today, the salaries

were examined in the electric railway industry they would compare favorably with salaries paid in any other industry in the country. The percentage of men in high executive positions who have not had the advantage of a college education, but have been technically trained and have natural ability, will also be found to compare favorably with the percentage in banking and other lines of business.

QUESTION: Then, if we really have a good opportunity for young men in the transportation business, what ought to be done to promote courses in public utility economics in the universities?

MR. BUDD: That should be actively instituted in every state in the Union, not only as a matter of getting the technically trained young men into the industry, but also men trained in the schools of commerce or business administration. There is just as much need in the business and financial and administrative side of the business as there is in the technical side, and the opportunities are just as great.

If utility courses were instituted in the universities it would be the means of educating the student body and the faculty and the administrative bodies of the universities in the needs and the problems of the electric

railways, all of which would be most helpful to the industry and to the country. There ought to be an effort made in every state to see that public utilities or electric railway courses are included in the curriculum of every university and technical school. And the electric railways ought to interest themselves in a well-defined plan of taking graduates, a liberal number of graduates each year, into their service. They ought also to have some kind of instruction in their individual companies for the benefit of those men who have not had the opportunity to go to college. There are many

men in the ranks who, with a little help through instruction and correspondence courses, can so improve themselves that they will of their natural ability make very desirable executives.

QUESTION: I would like to switch for a minute to the matter of wages. What do you think is going to be the wage situation in our industry in the next few years?

MR. BUDD: I do not believe that wages will materially recede from the present standards. There may be some decrease, but as a general thing I think the present standard of wage and living conditions and so forth are going to obtain in this country for an indefinite time.

QUESTION: That does not mean much prospect for lower fares, does it?

MR. BUDD: No, I do not think so. I do not think there will be any opportunity for that except possibly through an increased volume of business and relieving the car riders of some of the burdens

of taxation and burdens of paving, and burdens of various kinds that are loaded upon them.

MODERNIZATION THE PRINCIPAL AID TO THE INTERURBANS

QUESTION: In general, Mr. Budd, what is the future of the interurban railways? They are the hardest pressed members of our industry now.

MR. BUDD: Well, to my mind, all these interurban roads of every kind and character, if there is any possible justification for it, ought to obtain modern, light, speedy equipment, and meet the changed conditions with like changes of cars, and obtain economical operation and speed.

Now, if they cannot compete with present conditions with those modern means, why, I do not know any other thing for them to do. You know that it is obvious that a good many interurban roads were unwisely projected with no economic reason for their construction. A little competition by the private automobile, taking away the margin above bare existence that did prevail, brings such lines to the point where they no longer can exist, but it does not change the fact that originally they should not have been built.

Low Children's Fare Builds Good Will

THE rate of fare for school children should be made just as low as it is possible to make it, to encourage the use of railway service by the young people. This should be done not only as a matter of performing a useful service to the community, but also to cultivate the good will of the parents. On the North Shore Line, although we have increased our rate of fare a number of times, each time I have held firm on this question of the rate for school children. And I believe that this was one of the things that did much initially to make the people in that territory feel that we are the right sort, and have the right ideas; whereas if the rate of fare for those children had been raised, we probably would have had every parent up in arms against us.

We hear a great deal about the abandonment of interurban roads, and that the abandonment is the sign that the automobile is going to supersede the electric railway. That is all fallacious reasoning. We see factories all over the country that at one time were in operation, but due to some changed condition or some reason or other they are vacant. Smoke is no longer coming out of the chimney and they are abandoned. Whatever their activity was, the time is past for it or the conditions are changed so that they can no longer operate. Well, that is the history of many different enterprises, and it has no significance whatsoever.

Public Relations a Continuing Task

WHAT more can we do? Well, if every company was doing its utmost to give the best service it was capable of, and its employees were actuated by an earnest desire to serve and to make friends, and if the facts and information about the company and its service and its problems were being disseminated continually year in and year out, if every company was liberally advertising year in and year out, if it was talking its problems before public bodies year in and year out, if it was seeing to it that every one, including the children in the schools, was informed, then I would say that maybe there was nothing more to do, except to do all that every year, year in and year out. But there are a lot of companies that are not doing a thing.

On interurban lines not having sufficient population tributary to them, it is possible that even with modern equipment and greater speed they would not be able to change the results.

So, as far as the interurbans are concerned, I do not think that, with modern equipment and aggressive business methods, and the use of the bus where it is necessary to use it, they are going to do anything other than improve, and in the course of time expand, if the territory they are operating in has the requisite population to support them.

QUESTION: You think that is true in spite of the competition of the private automobile, which is the most serious factor right now, I guess?

MR. BUDD: Yes. You must recollect that our span of view is kind of short. We are looking at three or five years in the past and maybe two or three years in the future, but this country is growing at a tremendous rate. What may seem a deplorable situation today, in three or four or five years from now will be an entirely changed situation. Cities are growing. Country districts are growing and the automobile is bringing population into the country. We are a great, growing country and we are going to need more and more transportation. We may possibly have periods when we seem to have too much of one kind or another, but in ten years we will wonder how we ever thought

about getting along with what we have. We will have to have a whole lot more.

The automobile has done more than anything else to create the restless spirit in the people that keeps them moving all the time. People are not contented to sit at home all day Sunday and holidays like they used to be, and those who have automobiles use them, and those who have not accept auto rides when they can and use other forms of transportation. And then when the use of the automobile grows to such an extent that they cannot make time, they go back to the railroads.

QUESTION: Then do you figure that the building of good roads tends also to build up electric line traffic?

MR. BUDD: Indirectly, yes.

GOOD POSSIBILITIES IN FREIGHT

QUESTION: Should the interurbans go after freight and express business in a good strong way? Is this one of their best fields of endeavor?

MR. BUDD: If the electric railway is going to enter into the field of transporting merchandise it should seek to give this service in a better way, or a faster way than it can be done by any other means; in other words, give a superior service. The company should not go at it half-heartedly, and even if it is only done in a small way, the business should be handled more satisfactorily and more efficiently than it can be done by other carriers. Interurbans can do that by a little organizing and with equipment suited to whatever the necessities may be. But they cannot hope to make any money or build up any very considerable business unless they have the proper tools, equipment and facilities for conducting the business. If they can give this superior kind of service, they not only can do it profitably, even more profitably on a car-mile basis than the passenger business, but they can obtain good will, the friendship and support of the business men and the industries in their territory as well. The freight business is simply another means of giving greater service.

The greater the number of useful services that the interurban can perform, the better its prospects for profit. I think a great mistake of the electric railways in past years, particularly the interurbans, has been a sort of half-hearted, half-organized attempt at performing some kind of a service. Now, then, the thing to do is to get the service on a high plane, if you are going to do it at all, and not permit it to be simply a makeshift, a shiftless sort of an effort.

The merchandise business can be developed very rapidly. Of course, it will bring many problems with it, and as it grows there will be need for additional capital, especially in terminal facilities, which are difficult and costly to obtain. But this is one class of business you must have facilities to do business with or else the cost of operation will just simply exceed all possible income.

Freight is handled economically in proportion to the efficiency with which it is handled, and if the efficiency decreases, the costs mount in a greater ratio than the decrease in efficiency. It is a very peculiar thing. For instance, if a company has terminal facilities to handle 100 tons a day and it attempts to handle 200 tons a day, the rehandling, the delays and the losses mount with tremendous rapidity as the congestion increases. Under such conditions everything is handled probably two or three times over, and this cannot be done with any degree of satisfaction or economy.

QUESTION: What about pickup and delivery service?

MR. BUDD: Well, I have advocated at various times—we do not do it ourselves—that the electric railways keep out of the pickup and delivery business, because it usually cannot be included in the rate. If it is included in sufficient amount, the rate may be reduced from time to time so that this service will become a burden and possibly make the whole business difficult to conduct profitably. This subject is still an open question in my mind though. If a pickup and a delivery service were possible that would lessen the terminal investment, it might be a desirable thing, for terminal facilities run into vast amounts of capital that have to be constantly increased and you can hardly keep pace with the necessity for expansion.

Now, it seems to me that the problem of concentrating all this freight in terminal freight houses is something that ought to be minimized. It may be that collecting stations or receiving stations at different points convenient to the shippers might form an answer to the problem. From these points the railroad company could truck the stuff to its cars, having it sorted so that there would be little or no delay in loading into the proper cars.

But that whole problem of pickup and delivery and containers and terminal freight houses is such a complicated thing and differs so widely in different communities that I do not know how to express an opinion about it. Personally I am inclined to think that the steam railroads will have to come to some kind of receiving stations, and I do not see why the same thing is not applicable to some extent to interurban roads operating out of big communities, to which the freight will be delivered by the shipper and then the railway company will pick it up at the receiving station and take it to its cars, or its freight houses. That would get away from all this concentration of trucking coming to the freight house and the delay and expense to the shipper trying to get his trucks in and out.

QUESTION: We have not reached the limit by any means, have we, in the application of the one-man car in interurban service?

MR. BUDD: No, nor have we reached it in city service. I think that the one-man interurban and city car—light, small cars with frequent service and low operating costs—is the solution of many difficulties on the part of many companies. They have not realized this to the fullest extent.

We had an example of what the small cars will do in Milwaukee. Some of the fellows thought we were absolutely crazy to put one-man single-truck cars on that city service. We cut the interval between cars in half or better, and increased our gross 50 per cent.

And pleased! Those people up there are tickled to death to ride in those little cars with the plush seats; a great many are riding only a few blocks now.

Take it in Waukegan, a city of 20,000, where we had practically no riding on the old street cars. We had our six-minute rush-hour service and fifteen-minute headway the rest of the day and nobody rode. People did not think about riding. But now I venture to say that you cannot go up there at any hour of the day or any hour of the night up until midnight that you won't find those little cars with every seat taken. A person comes out of the house and they have only got to go four blocks maximum, and there is one of these little cars right in sight, and they simply jump aboard. There is a large amount of riding of four or five blocks in both these cities, showing that people

can be induced to ride and make it a fixed habit and pleasure and convenience—a kind of rider we are not getting at all with old equipment. I do not see why there is not a tremendous opportunity for the railways in utilizing these little cars in frequent, fast service if there is any way to avoid duplicating equipment, where it is necessary on heavy routes to use big double-truck cars during the rush hours. The business is there for the frequent one-man operation. In the two places where we have tried it it has just increased the business exactly 50 per cent, and almost instantaneously. Those people must have been walking;

Determine to Give a Superior Service

IF the electric railway is going to enter the field of transporting merchandise it should seek to give this service in a better way than it can be done by any other means. Interurbans can do that by a little organizing and with suitable equipment. But they cannot hope to make any money or build up any considerable business unless they have the proper tools, equipment and facilities for conducting the business. If they can give this superior kind of service, they not only can do it profitably, even more profitably on a car-mile basis than the passenger business, but they can obtain the good will, friendship and support of the business men and the industries in their territory as well.

I do not know where else the increase in patronage could have come from. They were there. The city has not changed its population. Our Waukegan lines never paid the interest on the investment in all of their twenty years. It commenced new and deteriorated and the track and the pavement and the reputation and everything else went to pieces—and today everybody is riding. I was up there last night and they were coming and going, every car filled, and all of them apparently happy. At least, they looked happy to me; I was happy.

We put a lot of new money into that property and bought a lot of new equipment, and it is earning, after charging about 4 per cent reserve for depreciation, a little better than 7 per cent on the total investment. It has not done that before in twenty years. It has barely paid operating expenses. That little city property ran about \$250,000 last year and the population of Waukegan and North Chicago and the Naval Station is approximately 30,000. Over four million passengers in a city of 30,000 is pretty good riding—a riding habit of about 140.

NEW TRAFFIC CAN BE CREATED

About that idea of increasing the business, I am convinced that it is possible to create new traffic. We hear a tremendous lot of talk about the North Shore line getting all the business and taking it away from the other carriers and all that sort of thing. If there

were any way of analyzing it I believe it would be found that a very large percentage of the North Shore Line's business never existed prior to our giving this service. It was not there, and if our service were not there now, that riding would not be there. In other words, we have simply made it easy for people to travel, to visit and to do business. It is a natural thing, it is not unpleasant, it is not a fatiguing journey. Consequently, where a man might have taken a trip once in six months formerly, he now thinks nothing of taking it every week.

Now, we fellows in the transportation game are very prone to think that the only traffic available is that where the rider is required for some reason or other to travel, whether it is in the city or whether it is in the interurban field. I tell you, you can just as well increase the quantity of travel as you can increase the sales of some class of goods over here at Marshall Field's by proper merchandising and by proper standards. That is something we do not appreciate. We are inclined to think that when business is increasing it must be due to the fact that everybody is employed and that the weather is fine, and all that. But back of all that is the question of whether that service is encouraging travel. If it is encouraging travel, a natural momentum of increased travel is being built up all the time. That is a factor I think we could well pay a lot more attention to, because our people throughout the country do not appreciate that there is a great reservoir to draw from. They do not think of it in terms of possible business, and yet it is there. There is no question about it. The amount of travel tends to be cumulative. As the habit increases it tends again to increase.

I am always convinced of that right here in Chicago with our elevated system. If we had adequate track capacity here in the heart of the city and more express tracks in the outlying districts, I do not think there is any limit to the amount of business that we could get. The only limit would be the extent of our service and equipment.

Supposing you had a customer up in Racine or Kenosha and you were not particularly anxious to go up there because it was a tiresome journey. But on

the other hand, that customer could be of help to you, maybe you could sell him more goods or maybe he could help you sell goods somewhere else. Now if it is easy to see him and it is to your profit to see him, you will see him easily twice as often, possibly three times as often as if it were an arduous, tiresome, time-consuming journey. Then, you would be likely to write him letters instead of jumping on the train and going up to see him. I think that is just exactly what has happened in our case.

The same situation exists with this merchandise service. We have a great many cases where men doing business in Chicago no longer keep any stock in Milwaukee. They ship right out of their Chicago stock and fill their daily orders. The same thing is true in Milwaukee. Merchants there ship from their Milwaukee stock to Chicago and do not keep any stock in Chicago because they can get daily delivery. And that seems also to stimulate a greater amount of travel because in a measure it would practically allow for the expense of at least a man's time traveling because it is unnecessary to keep a warehouse in the other city. We have a lot of that kind of business.

QUESTION: What is your motive for putting plush seats in the new cars of the elevated?

MR. BUDD: Well, it is just the idea that I was talking to you about of making the car a little more comfortable and a little more pleasing in the interior—electric fans and shaded lights and plush seats—all with the idea of really making a more comfortable conveyance. Our fellows differed very strongly on this seat proposal, but I am convinced it was the right thing. When we get some more cars next year I am going to put some more new things in. I do not know just what they will be, but I am convinced that they are business getters.

QUESTION: I wish we could spread a little of the optimism of your organization all over the country.

MR. BUDD: Well, you see we have had so many hard knocks that even the faintest kind of smile looks to us almost like sunshine. We have been brought up on adversity and these things make us cheerful.

THE greater the number of useful services that the interurban can perform, the better its prospects for profit. I think a great mistake of the electric railways in past years, particularly the interurbans, has been a sort of half-hearted, half-organized attempt at performing some kind of a service. Now, then, the thing to do is to get the service on a high plane, if you are going to do it at all, and not permit it to be simply a makeshift, a shiftless sort of an effort.

Eliminating Half the Accidents in El Paso*

In Five Years the Cost of Accidents Was Reduced from 15.7 per Cent of Gross Earnings to 2.5 per Cent—Gold Stars for Trainmen with Clear Accident Records Encouraged Safe Operation—A Breakfast at 3 o'Clock in the Morning a Feature in the Campaign

NINETEEN months without a fatality, either in the street, on the cars or to employees, during which time the cars of the El Paso Electric Railway traveled 4,855,000 miles and carried 47,900,000 passengers, is the record of accomplishment under the leadership of Alba H. Warren, manager.

Accidents have decreased from 1,767 in 1921 to 1,401 in 1922 and, based on seven months' operation, to 940 in 1923. The best monthly record is for July, 1923, with

responsible, he could have avoided it by the use of extraordinary care, it is charged against his record.

One of the very beneficial features which the plan has brought out is that every operator is exceedingly anxious to be absolved from blame, and he not only runs his car with the greatest caution but, in the event of an accident, he does everything he can to secure all the witnesses and necessary data to exonerate himself. In a very considerable number of cases the injured

Even the Car Step Signs Are Used to Direct Attention to Carefulness

only forty-nine accidents, compared with 109 for July last year and 147 two years ago.

The story probably begins with the inception of the "Honor Roll" and "Gold Star" plan, which were put into effect in October, 1919.

Every trainman who operates three months without an accident being charged against his record is given a day off on full pay. A committee, composed of an assistant claim agent, the assistant to the railway superintendent and the chief inspector, passes on each accident reported and if, in its opinion, the accident was one which could not reasonably have been avoided by the exercise of extraordinary care on the part of the operator, he is not charged with it. If, on the contrary, it appears that, even though he was not directly

party is asked to write a statement absolving the operator from blame. These statements, and the data secured by the trainman to exonerate himself, naturally are of great importance to the claim department and assist it in declining many claims which might otherwise have to be settled.

Inspectors, and all men in the operating department, are constantly striving to increase the number of men on the honor list, and the co-operation thus engendered has surpassed anything which had been hoped for. A man who stays on the honor list twelve consecutive months is given a gold star, which he wears on his sleeve, and receives an additional gold star for each succeeding twelve months during which he remains on the honor list. A soldier could not be much prouder of a medal of honor than are these men of their gold stars. There were in July, when this article was written, four men wearing three gold stars and likely to receive their

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

fourth in October, and seven other three-star men; twenty-five men are wearing two stars and thirty-seven one star. Aside from the pride which the men have in them, these stars create a very favorable impression on the riding public. There has been no kick-back of any kind, and it is believed that eventually many companies will adopt some similar plan. From 85 per cent to 90 per cent of the trainmen secure a day off on full pay each month.

This has not only had a tremendous effect on the reduction of accidents but has very materially increased the morale of the men. The cost is but a small propor-

Fatalities Have Been Reduced to Zero from an Average of Five a Year by Means of the Safety Campaign

tion of the money saved, and the remarkable effects of the plan have been manifested in many ways aside from the actual reduction of accidents and the consequent cost. One of the local papers ran daily a picture of a gold star man, under the caption "Do You Ride With This Star Operator?" and under the picture was a brief history of the man and his work.

BULLETIN BOARD PORTRAYS ACCIDENT RECORDS

In addition to the monthly bulletins, which are posted showing the names of those on the honor list and the number of months which they have been on it, a very interesting board is kept which affords, in a permanent way, an accurate portrayal of the trainmen's accident records. A large board, incased in glass and illuminated by several electric lights, contains a chart for each trainman in service. On this chart the name of the trainman is given, the date that he entered service and the dates and kind of accidents which he has had. On the first day of the month these cards are all placed on a side of the board bearing the title "No Accidents This Month." As the month progresses and the trainmen report accidents, these cards are moved to the other side of the board under the title "Accidents This Month." These cards show all accidents reported, regardless of whether they are charged against the man's record or not, and also have affixed in one corner a tiny gold star for each year the trainman has worked without an accident being charged against him. The cards are all arranged alphabetically, and every trainman's accident record may be seen at a glance. This record, being kept constantly before the view of all trainmen, has a tendency to inculcate in them a desire to make a good showing before their fellow workmen.

As a result of the enthusiasm in accident prevention aroused in the men, they have held meetings of almost every description, groups from various departments, night men and day men, men from one line with men from another, line inspectors, dispatchers, and, in fact, almost every conceivable combination. Upon their own

initiative line meetings are held by divisional inspectors, and the records of that particular line are gone over very carefully and the records of the individuals operating on it are checked up and discussed. An indifferent operator hasn't much chance of success among these men, and pressure is brought to bear on him by the men as well as by the officials.

In the early part of this year the night men challenged the day men to an accident contest covering a period of one month, the losers to pay for a banquet for the winners. The contest aroused a tremendous interest among the men, and the banquet, for which the night men had to pay, was one of the most successful affairs which had ever been held in connection with the company's business. Another contest was held and this time was won by the night men, and again a banquet was enjoyed by the winners.

A BREAKFAST AT 3 O'CLOCK IN THE MORNING GETS THE ENTIRE ORGANIZATION TOGETHER

For a long time the company had tried to devise some plan whereby all of the trainmen could be got together at one time. Meetings, dinners and suppers had been given without number, but were always attended either by the night force or the day force, but never by both in a body. The two contests above mentioned furnished an idea. Mr. Warren, the manager, told the men that instead of their working against each other, he would suggest a contest between the men as a whole and the company, and he proposed that if they could go through the month of April without exceeding ninety accidents, he would give the entire organization a breakfast at 3 o'clock in the morning. The scheme met with instant and enthusiastic reception, and the men set to work with greater zest than they had ever before shown. Every accident reported during the month was scrutinized by almost every man in the organization, and

The "Accident Clock" Was Used to Indicate for a Month the Hours at Which Various Types of Accidents Occurred

the offender was made to feel the severe displeasure of his more fortunate brothers. The daily newspapers carried articles giving the number of accidents to date, and there was a very general interest in the contest manifested throughout the city. The Automobile Club asked its members to be unusually careful in order to help the trainmen win. School teachers cautioned their pupils and industrial plants cautioned their men. After

a contest, almost as exciting and interesting as that occasioned by baseball teams for the world's championship, the men won with a score of 89, just one within the mark set.

The banquet was attended by the Mayor and Aldermen of the city of El Paso, the Mayor's representatives the Aldermen from the city of Juarez, Mexico; United States and Mexican customs and immigration officials, the Chief of Police, the City Treasurer and countless newspaper men and public spirited citizens, and finally, a Major-General of the United States Army. Beforehand it was feared that on account of the hour the program would drag, and it was, therefore, made as brief as possible, with the idea that the breakfast, which actually started at 2 o'clock, would end at a quarter to four. Instead the breakfast lasted until 5 o'clock without any slowing down whatever of the program, and in fact ended all too soon for every one present. Incidentally, trainmen who had been unfortunate enough to have accidents during the month served as waiters.

OTHER SAFETY MEASURES

The honor system has not alone been responsible for this splendid climax of the safety program. Throughout the entire organization every department has brought its best thought to bear on the accident situation, and nothing has been overlooked from the mechanical end and from the standpoint of public co-operation which could assist in carrying out the work. Dashboard signs and posters carry warnings to the public about certain types of accidents, beseeching them to be careful, and at other times pointing out the desirability of the service.

Inspectors make daily checks of cars on the line and impress on trainmen the necessity of caution at all times. They ride with the men during quiet hours, instructing them in making easy stops and starts, how to handle accidents if they happen, how to secure signed statements, etc.

A large personal record book furnishes invaluable assistance in following the work of the trainmen and in affording accurate information as to the individual's capability. Each trainman has a page in the book, and on this page an accurate record is kept of all matters pertaining to his work, the number and kind of accidents, the number and kind of violations, complaints on the part of his passengers, from his passengers, etc. The superintendent may, by going through this record book, tell at a glance the men whose work is below par, and he is able to detect very quickly men who have been reported or cautioned for careless operation. On the theory that a habitually careless man is, in the very nature of things, bound to have serious accidents sooner or later, men who the records show are not operating as they should be, after having been properly instructed and cautioned, dismissed from the service. This is a much better plan than locking the door after the pony has escaped and has been a considerable factor in assisting in avoiding preventable accidents.

Charts are constantly kept before the trainmen showing them the kind and number of accidents which occur each day, giving comparisons with previous months and previous years, and in addition to this a large stand, supplied with pads of paper the size of a double newspaper page, is used to make special pleas to the men, or to call certain matters definitely and forcibly to their attention. Colored crayon is used in writing notices on this stand.

In the clubroom and carhouses, in the shops and in several other places there are "Safety First" suggestion boxes with blank cards in a box beside them. On the face of each box is a statement to the effect that many possible improvements in the company's practice occur to the men before they are discovered by the management, and that each employee who thinks of something that might better the service or eliminate an accident hazard should convey the thought to the management through these cards. A surprising number of valuable suggestions are made and adopted.

In the superintendent's office a large backed map of the city is used to show the kind and location of accidents. Pins of various colors show derailments, trolley breaks, collisions with automobiles, collisions with other vehicles and collisions between cars. This map is of considerable value in locating places where particular types of accidents are occurring, with the result that immediate efforts may be brought to bear to correct the condition. This map is cleaned off and started anew on the first of each month, and at the end of the month a permanent record is made from it. In addition to the map, an accident clock is used, on which the hour in which accidents occurred is designated. This, too, is a monthly record.

In case of an accident the divisional inspector is notified at the same time that the attention of the claim department is brought to it, and because of his proximity to the scene of the accident he is frequently on

A Feature of the Newspaper Publicity Was a Series of Portraits Like This

hand and secures valuable information prior to the arrival of the investigator. The report which he makes oftentimes covers information which would otherwise not be obtained.

Various warning signs, including those prepared by the American Electric Railway Association, have been used with good results. When the operator opens his door to take on passengers the step is lowered and a sign bearing the words "Watch Your Step" shows up on the body of the car just above the step, but it is not visible when the door is closed and the step raised up.

The public generally pays very little heed to such signs as "Do Not Talk to the Motorman." It was felt very necessary in the safety campaign to eliminate this practice as far as possible, and a small placard was designed which was placed in the vestibules of cars on the reverse side of the route sign boxes. This sign is worded as follows:

"Please stand back far enough not to obstruct the motorman's view. His failure to see might cause a serious accident."

"The motorman will cheerfully give you all necessary information, but please do not engage him in unnecessary conversation, thereby distracting his attention from his work."

The consent of the superintendent of public schools has been secured to introduce safety as a regular part of the curriculum of all public schools throughout the

city. Beginning with the September term, a talk on safety will be made each week by every teacher in each school. In addition to this, members of the company's organization and representatives of the Automobile Club will make talks about once a month. The Automobile Club and the daily newspapers also put on a "Safety First" week. The July record of only forty-nine accidents was in part due to the "Safety Week" sponsored by the El Paso *Herald*. Other similar campaigns for civic safety are also being worked out.

In answer to the question as to whether these things have really been worth while, the following figures can be quoted:

**TOTAL COST OF CLAIM DEPARTMENT, SETTLEMENTS,
FIXED CHARGES, ETC.**

Year	Total Amount	Per Cent of Gross Earnings
1919	\$111,000	15.7
1920	71,000	7.7
1921	61,000	6.3
1922	31,000	3.5
1923	23,000	2.5*

*Based on seven months' operation.

This means a reduction of from 15.7 per cent to 2.5 per cent of the gross earnings. The figures given include all the expense incident to the operation of the claim department, as well as all settlements, and a feature of the situation is that the total outstanding liability is estimated at only \$2,000.

Railway Has Ample Supply of Free Coal

A UNIQUE feature of electric railway operation in the Susquehanna Valley of Pennsylvania is the fact that free coal is available to all. The Susquehanna River flows down from the anthracite mining district and carries with it large quantities of fine hard coal. This material collects at various points along the course of the river and is reclaimed by the use of suction dredges. The Harrisburg Railways avails itself of this supply of free coal and the only expense is that of dredging and hauling to the power house.

Convenient Waiting Station

A SHORT time ago the Boston Elevated Railway had occasion to reconstruct its Park Street division headquarters in Dorchester. At the corner of the lot is a busy transfer point, and the management arranged to install a small but very convenient waiting station for passengers. It is of reinforced concrete one story high and without doors.

Convenient Waiting Station of Boston Elevated Railway on Park Street

Company Helps Employees Buy Homes*

Legal and Financial Aid Afforded—More than 75 per Cent of the Employees Take Advantage of the Opportunity

BUILDING and loan associations organized primarily for the benefit of the employees of an electric railway company are so rare that they are worth mentioning. The Colorado Springs & Interurban Railway has made arrangements with the financial interests connected with that company by which it has been able to assist its employees in buying homes. The plan is very simple and is as follows:

The employee selects his home in any part of the city that he may desire, without any dictation or suggestion of any kind from the company, except that the price paid shall not be in excess of that which the company deems to be a fair price. The company's attorneys examine the abstract of title without charge to the employee. The property is then purchased for cash, the employee paying 10 per cent on the purchase price or as much more as he may desire, and the company paying the rest. The contract between the company and employee requires that the latter shall refund his loan from the company at the rate of \$1 a month for each \$100 of the principal of the loan, and that he will pay interest at the rate of 5 per cent per annum on the monthly balance, the employee having the right to pay as much more on the principal as he may desire at any time. The contract further provides that payments will be suspended during sickness. If the employee leaves the service of the company, either voluntarily or involuntarily, he may carry on the contract the same as if he had remained in the service.

MANY EMPLOYEES PURCHASE HOMES

There are about 185 regular employees of the company and 145 contracts have been issued. Approximately \$265,000 has already been loaned by the company and approximately \$130,000 has been repaid on the principal. No contract has been forfeited, as no employee has failed to comply with the contract. Over 50 per cent of the employees have paid in more than the contract called for.

Some time ago the company took out a group life insurance policy for its employees with a large life insurance company, covering the lives of all its employees in the sum of \$1,000 each. The premiums on this policy are wholly paid by the company, and it has been found a great aid to the widow of an employee in caring for any unpaid balance that there may have been on the home contract at the time of the husband's death.

As shown by the large number of employees who have taken advantage of this plan, it is considered a desirable one by them. The company considers itself benefited because it believes that a home-owning employee is apt to be more reliable and careful than one who is not such a property holder. The plan has also tended to create favorable public sentiment, because the public looks with favor upon every plan which results in an increase in the number of home owners and taxpayers in the community.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

Traffic Increasing in Populous States

Census Figures for Eight More States and the District of Columbia Show that More Passengers Were Carried in 1922 than in 1917 in Every Case Except Ohio—California Leads with 46.5 per Cent Increase

THE healthy condition of the electric railway industry in the more important states is shown by the figures recently released by the Bureau of the Census. Earlier figures for sparsely settled states showed slight decreases in passenger traffic in several cases, but in the more thickly populated districts the passengers carried in 1922 was substantially greater than in 1917.

Georgia—The figures show a slight decrease in track mileage while passenger traffic increased by 14.6 per cent in 1922 as compared with 1917. Gross railway operating revenues aggregated \$7,703,960, an increase of 52.2 per cent and net income from all sources made a gain of 106.4 per cent.

	1922	1917	Per Cent of Increase, 1917-1922

† Reduction due to mergers and to companies which have discontinued operations.

†† All generating equipment reported in 1922 was idle, and in 1917 the greater part of the power equipment reported was not in operation.

** In addition there were 2,826,815 passengers carried by fifty-five motor buses operated by electric railway companies.

Louisiana—The comparison of 1922 operations with those of 1917 are influenced to a considerable extent by the fact that in 1922 one of the largest companies in the state furnished a combined report covering both its railway and electric light and power departments, while in 1917 separate returns were secured and the data relating to the production and sale of electric current were included in the special report on this subject and not in the statistics relating to railway operations. This change in method of reporting is due primarily to a reorganization of the company in question.

The figures show a decrease of 7.8 per cent in track mileage and an increase of 22.8 per cent in the number of passengers carried. Gross railway operating revenues amounted to \$9,448,195 in 1922, an increase of 60.6 per cent; operating expenses increased 83.1 per cent and net income made a gain of 198.6 per cent.

†† Includes 98.74 miles in 1922 and 76.14 miles in 1917 lying outside the state but owned by companies within the state, and excludes 26.39 miles in 1922 and 25.51 miles in 1917 operated in the state but owned by companies outside the state.

‡ Reduction in current generated due chiefly to change in operating conditions of one company which produced a large quantity of current for sale in bulk in 1917 while in 1922 only a relatively small amount was generated for sale.

** In addition there were 1,088,295 passengers carried by thirteen motor buses operated by electric railway companies.

Combination Club, Observation and Dining Car of Louisville-Indianapolis Line.

Interstate Starts Dining Car Service

Comfort and Luxury of the Interior Fittings and the Wide Variety Offered by the Menu
Are Features of the Combination Club-Dining-Observation Car Service
from Indianapolis to Louisville

NEW equipment recently put in operation in the all-steel limited trains of the Interstate Public Service Company rivals in the commodiousness of its appointments the rolling stock of the crack trains of the largest steam railroads. These luxurious cars, costing \$35,000 each, are in service on the Dixie Flyers leaving Indianapolis at 11 o'clock in the morning and 5 o'clock in the afternoon, reaching Louisville in three hours and forty-five minutes. Returning they operate on the Hoosier Flyers leaving Louisville at 11:45 a.m. and 5:45 p.m. Later it is expected that additional cars of this type will be used on other trains also.

The cars are combination club, observation and dining cars. Two-thirds of the car interior is devoted to a passenger compartment containing twenty-two individual chairs, upholstered in soft Spanish leather. Beside each seat is an electric push button connected

with an annunciator. At one end of this compartment there is a long comfortable seat upholstered in the same material. This easily accommodates four people, thus increasing the passenger capacity to twenty-six. The rear end is arranged for observation with heavy plate glass windows extending nearly from floor to roof. In conjunction with the possibility of moving the chairs to any desired position, this arrangement enables the passenger to get with the utmost comfort an excellent view of the country through which the car is passing. In this respect the car excels the typical open platform observation car on steam railroads, as all dust is shut out.

Side windows are also of plate glass and are equipped for winter with outside storm sash. Screens may be substituted in summer for the storm windows. The artificial lighting arrangements are attractive, consist-

ing of 100-watt dome lights in the center of each of the beams in the ceiling and 50-watt lights along the side. In addition there are emergency lights which operate from a storage battery whenever the power is off the car.

Portable tables which may be adjusted for the seating of two or four people, as desired, are part of the dining equipment. Place for the tables is made by simply rearranging the chairs. An extensive menu is provided, giving the passenger almost as large a choice of viands as he would have in a good hotel. Each car will have a crew consisting of a chef and a porter.

The kitchens are equipped in the same way as the kitchens of modern steam railroad dining cars. There is a cooking range, an ice box, provision locker and all other necessary features. The silver and china service are of the same high grade as the other equipment. The dining car service of the Interstate Public Service, Company has been placed in charge of C. C. Mowry, who until recently was assistant superintendent of the dining car service on the Monon Railroad.

African mahogany of a light shade is used for interior trim. The ceiling is beamed in the same wood with white enamel between the beams. The side walls are entirely of mahogany, as is also the kitchen exterior and the various compartments and cabinets at the end of the car. Extreme simplicity marks the interior arrangement and this adds to the pleasing effect.

A hot water heating system has been installed for winter operation. In addition to this, however, there is an electric heating system, which may be used in case of emergency or on cool days in the spring and fall when the regular heaters are not required. Each car is equipped with three large electric fans, and a blower in the kitchen to remove whatever fumes there may be from the cooking.

The cars were built by the American Car & Foundry Company and are 62 ft. in length over all and 9 ft. 2½ in. in width. Fully equipped, they weigh approximately 100,000 lb. Control has been so arranged that they can be operated as single units, although they will usually be used in multiple-unit trains, with a steel motor coach as the leading car. Each of the new cars is equipped with two G.E. 254 150-hp. motors on the front truck, geared for a speed of 70 m.p.h.

The additional fare on these cars between Indianapolis and Louisville is 75 cents per chair. Between Indianapolis and Columbus, Ind., the extra fare is 50 cents, and between Louisville and Seymour it is the same. It is 75 cents a chair from Louisville to all points north of Seymour and from Indianapolis to all points south of Tremore. It is the first service of this kind that has been established in the Indiana-Ohio interurban district and is proving very popular with the public.

Coal Consumption Cut a Third in Three Years

By Attention to All Sources of Power Waste, Including Uneconomical Car Operation, Union Traction Has Saved Fuel and Reduced Maintenance Cost

FOR several years the Union Traction Company of Indiana has had under way a continuous effort to reduce power cost with the result that there has been a gradual reduction in coal consumption as follows: 1919, 124,080 tons; 1920, 102,573 tons; 1921, 85,224 tons; and 1922, 81,998 tons. Along with this has gone fairly steady increase in car mileage, from 7,813,419 in 1919 to 7,885,644 in 1920, 7,871,025 in 1921 and 8,330,112 in 1922.

An important feature of the campaign has been the use of meters on the cars, but it has also included attention to track bonding, the use of lighter equipment and its proper allocation, modification of gear ratio where

Cards Used for Recording Energy Consumption on I. U. T. Cars Above, for interurban cars. Below, for city and suburban cars.

utable to the better handling of cars which came about through an effort to save energy by systematic coasting.

During the spring of 1920 the company installed Economy meters on its interurban cars. The company's safety engineer, R. E. Luellen, was put in charge of energy-saving activities.* It took some time to get the work organized, but by the end of the year it was in full swing. The result was a reduction from the consumption of 4.339 kw.-hr. per car-mile at the direct-current switchboard in 1920 to 3.803 kw.-hr. in 1921, or 12.3 per cent. The reduction for the following year

Energy Consumption per Car-Mile at the Cars on I. U. T. Interurban Lines

over 1921 was to 3.629 kw.-hr., or 4.6 per cent. Thus, the saving for 1922 as compared with 1920 was 16.35 per cent. The fact that it was possible to make an additional saving the second year shows that the novelty of the 1921 campaign was not an important factor in its success. The energy consumption at the car for the past three years or more is shown on the accompanying graph.

In connection with the manufacturer's engineers, the railway company devised record cards adapted to its needs, one for the interurban cars, and one for the city and suburban cars, as illustrated. The backs of the cards are utilized to explain means of securing econom-

ical operation without losing time. The men read the meters and make their own records.

The local superintendents gather the cards daily and transmit them to the safety engineer, who files each man's cards for a month together. The results for each month are tabulated by lines, with the corresponding data for the preceding month. A copy of the summary is posted on the terminal bulletin board, with a table of totals for the several terminals. For the interurban passenger motor cars, the grand totals for the system are graphed, as illustrated, for comparison with the preceding year.

In order to impress the men with the relation between energy consumption and coasting, demonstrations have been conducted on certain days as follows: The men were asked to estimate their coasting on given trips, by counting poles, and to read their meters correspondingly. Comparisons were then made with the energy consumption immediately preceding. The coasting was found to range from 30 to 36 per cent.

The Readers' Forum

Railways Fail to Sell Themselves to Graduates

UNIVERSITY OF PITTSBURGH

PITTSBURGH, PA., Dec. 13, 1923.

To the Editors:

I note with interest your editorial in the *ELECTRIC RAILWAY JOURNAL* for Dec. 1 under the title "Transportation Field Needs to Be 'Sold' to Faculties." This thought is similar to other editorials and articles which have been appearing in the technical press for some time with reference to many public utilities. I feel that there is another point of view to be considered in a question of this kind. I think you would find in a survey of the engineering faculties of this country that they all appreciate perhaps as much as you do the importance of not only the specialized transportation field but other special utilities.

Did it ever occur to you that engineering teachers have certain ethical obligations in connection with problems of this kind? It seems to me that it would be entirely out of place for engineering teachers to emphasize one or more public utilities at the expense of others. In my own case, for example, I am probably more interested in the transportation field than any other phase of engineering. And yet I am very careful in presenting this matter to my engineering graduates for the reason outlined.

I do feel, however, that in this particular case there is a solution for the problem. During the number of years in which I have been connected with engineering teaching, I have been impressed by the absence of any definite program on the part of railway organizations to "sell" themselves to engineering graduates. It is now commonly accepted practice among our leading electrical manufacturing and many utility companies to visit the leading universities and technical schools late in the senior year for the purpose of acquainting graduating students with opportunities in their respective fields. Herein, as I see it, lies the explanation of the failure to build up the personnel of many of our transportation utilities.

H. E. DYCHE,

Professor and Head of Department of Electrical Engineering.

*See article by Mr. Luellen in the issue of this paper for Oct. 22, 1921, page 728.

Association News & Discussions

Mid-Year Dinner Committees to Be Organized

A MEETING of local members of the committee on arrangements for the American Electric Railway Association Midyear Meeting was held at St. Louis, Friday, Dec. 21, at which the most important business was the report of the organization committee. This committee, which is in reality a committee on committees, has the responsibility of naming the committees and sub-committees, outlining their duties and functions and recommending their personnel to the general chairman, W. H. Sawyer. The members of this committee are C. O. Birney, chairman; B. W. Stemmerick, R. W. Williams, Herman Spoehrer and B. W. Frauenthal.

Two New Committees Organized by American Association

CONVINCED that the future success of electric railways lies largely in advancing the more general use of progressive methods, the executive committee of the American Association has authorized the formation of two new committees which will, broadly speaking, conduct a first-hand survey of the industry and report on the progressive work that is being done. This survey will include not only operating methods but the improvement of public relations and other activities of importance.

Each committee as organized consists of fifteen members. The United States has been divided into seven geographical districts, and a vice-chairman has been appointed for each. These men will do the field work for their respective committees. On each committee there also is one publicity man. The other seven members of each committee are executives of broad experience.

The success of the plan will depend in great part on the personality of the vice-chairmen and their ability to inspire confidence. Each one is expected to devote at least two weeks of his time, prior to July 1, to visiting and aiding the member companies in his district, both the time and expenses of the man to be borne by his employer company. One object of these visits will be to aid companies by advising them on how other companies are meeting problems, and another to seek advice and information for the benefit of the industry as a whole. While it is hoped that eventually it will be possible for the vice-chairmen to visit all member companies and extend help when needed, in the beginning it is suggested that they make surveys of the best properties in their territories.

The result of this work at the end of a year will unquestionably be to bring aid to a good many member companies, and, at the same time, make all the companies feel that they are a more intimate part of the American Electric Railway Association. The two committees also will have a rather comprehensive survey of the industry upon which to report at the annual convention.

The personnel of the two committees follows:

CITY OPERATION

H. B. Flowers, president New Orleans Public Service, Inc., New Orleans, La., chairman.

Regional Vice-Chairmen

R. F. Carbutt, New York, N. Y.
H. B. Potter, Baltimore, Md.
C. D. Porter, Hampton, Va.
R. W. Emerson, Cleveland, Ohio.
F. C. Chambers, Des Moines, Iowa.
W. E. Wood, Houston, Tex.
W. V. Hill, San Francisco, Cal.

Publicity

L. K. Starr, Atlanta, Ga.

Representative of Manufacturers

E. F. Wickwire, Mansfield, Ohio.

Members at Large

W. R. Alberger, Oakland, Cal.
G. H. Clifford, Fort Worth, Tex.
B. C. Edgar, Chattanooga, Tenn.
E. M. Graham, Bangor, Me.
C. W. Kellogg, Boston, Mass.
C. S. MacCalla, Youngstown, Ohio.
E. J. McIlraith, Chicago, Ill.
J. P. Pulliam, Milwaukee, Wis.

INTERURBAN OPERATION

Harry Reid, president Interstate Public Service Company, Indianapolis, Ind., chairman.

Regional Vice-Chairmen

F. W. Woodcock, Philadelphia, Pa.
H. L. Mitchell, Pittsburgh, Pa.
Samuel Riddle, Louisville, Ky.
J. S. Bleeker, Springfield, Ohio.
G. W. Welsh, East St. Louis, Ill.
V. W. Berry, Fort Worth, Tex.
W. V. Hill, San Francisco, Cal.

Publicity

Frank Blanchard, New York, N. Y.

Representative of Manufacturers

E. F. Wickwire, Mansfield, Ohio.

Members at Large

J. F. Collins, Jackson, Mich.
V. S. Curtis, New Haven, Conn.
H. A. Mullett, Milwaukee, Wis.
C. E. Thompson, Highwood, Ill.
J. C. Schade, Warsaw, Ind.

Power Transmission and Distribution

A MEETING of the committee on power transmission and distribution of the Engineering Association was held at association headquarters Dec. 10 and 11, the first day being devoted to the assignment of subjects and discussion of their scope, while the second day was given over to meetings of the various sub-committees. Those present were C. H. Jones, chairman; M. B. Rosevear, sponsor; G. C. Hecker, special engineer; J. W. Allen, Charles Gilman, C. L. Hancock, H. D. Hawks, L. T. Hixson, H. S. Murphy, J. F. Neild, H. A. Pharo, W. J. Quinn, W. Shaake, A. Schlesinger, J. M. Waldron, F. J. White, J. H. Drew, Mr. DeVries representing Adrian Hughes, Jr., and R. W. Eaton, who also served as secretary of the committee.

F. McVittie was appointed vice-chairman.

Tentative dates for this year's meetings of the committee were discussed. It was voted to hold the next meeting at Chicago, March 10 and 11.

The subjects assigned to the committee were considered in order, and the work proposed was referred to the sub-committees. The subjects include concrete poles, ruling dimensions of approach ears, dimensions of various types of suspensions, catenary suspension, trolley wire wear and composition, temporary connection to trolley wire, trackless trolley overhead construction, review of existing standards, and signal sections of the engineering manual.

On the subject of trolley wire, it was suggested that a joint special committee be organized from members of the power distribution and equipment committees to study the whole problem of current collection. It was also proposed that members of the power distribution committee put up "test miles" of trolley wire and obtain the life history of such installations.

Attention was called to the necessity for standardization of designs of approach ears so that the parts might be made less diversified and to some extent interchangeable. The same action was considered necessary for barn hangers and other hangers used in troughs.

Committee on Relief of Traffic Congestion

AT A meeting held at the Congress Hotel, Chicago, on Dec. 14, the T. & T. Association committee on relief of traffic congestion considered the preparation of a questionnaire to be sent out to member companies for the purpose of collecting data and studying means of relieving the increasing street con-

gestion in the larger cities. With men present from various parts of the country, it was found that all had ordinances limiting parking and providing other regulations, but that these were not proving satisfactory in relieving the congestion. Chairman Paul E. Wilson of Cleveland presided. The meeting was attended by G. B. Anderson of Los Angeles, W. E. Thompson of New York City, D. L. Fennell of Kansas City and J. V. Sullivan, sponsor, of Chicago.

City Operation

THE committee on city operation of the American Association held its first meeting at Chicago, Dec. 14. Those in attendance were H. B. Flowers, chairman; R. F. Carbutt, R. W. Emerson, H. B. Potter and W. E. Wood, regional vice-chairman; M. E. Ailes representing L. K. Starr, publicity member; E. F. Wickwire, manufacturer representative; J. P. Pulliam, E. J. McIlraith, C. S. MacCalla and V. W. Berry representing G. H. Clifford, members at large; S. E. Emmons and E. J. Blair, guests; Labert St. Clair and G. C. Hecker of the association staff.

The secretary read the plan of organization and procedure, after which the aims and objects of the committee were discussed. As to the best method of starting the work, various plans were presented.

A number of subjects mentioned for investigation by the committee included the motor bus, traffic congestion, lightweight cars, one-man operation, power saving, etc. It was felt that one thing to which the committee might devote some attention is the question of higher schedule speeds. The slowing down of schedules in city operation was held to have brought about greater use of the motor bus and the private automobile.

H. A. Johnson, president of the Engineering Association, who was present at the afternoon session, spoke of the trips made by representatives of the Chicago, North Shore & Milwaukee Railroad and said he felt the benefits derived from these trips had crystallized President Budd's ideas and resulted in the formation of the committees on city operation and interurban operation. In his opinion the way to start the committee work was for the regional vice-chairmen to go out into their territories and visit the properties. He said that the resulting interchange of ideas would benefit both the regional vice-chairmen and the managers of the properties visited. He thought a meeting of the regional vice-chairmen should then be held in order to report and discuss what they had found.

President B. I. Budd was at the meeting for a short time and spoke of the possibility of manufacturers and bankers working out a plan for financing modern equipment to replace antiquated equipment. He pointed out what the motor bus manufacturers have done along that line. He also expressed the belief that increased speed and relief of traffic congestion are very important.

He said he thought the committee might begin to prepare publicity material for future use, stressing the expensive street widening projects and boulevards undertaken by the municipalities for motor interests, and pointing out at the same time that practically nothing of that nature has been done for the street car riders, who constitute probably 80 per cent of the general public.

Mr. Budd expressed the hope that the committees would furnish information and ideas leading to modernization and toward further development of the industry. He said the industry has not by any means reached the limit of its development, and that if we can only get rid of some of the nightmares of the past and become imbued with the desire to give better service and promote better public relations the industry will go forward rapidly. He mentioned the enthusiasm and energy displayed in the early days of the industry and said that if the committees could only arouse a part of that spirit on the part of the managements today a tremendous amount of good would result.

It was decided to hold the next meeting at New York Jan. 10.

Interurban Operation

THE first meeting of the committee on interurban operation of the American Association was held at Chicago, Dec. 12. Those in attendance were Harry Reid, chairman; H. L. Mitchell, Samuel Riddle, G. W. Welsh, F. W. Woodcock and V. W. Berry, regional vice-chairmen; Frank Blanchard, publicity member; H. A. Mullett, C. E. Thompson and J. C. Schade, members at large; M. B. Lambert and C. L. Van Auken, guests; Labert St. Clair and G. C. Hecker of the association staff. E. F. Wickwire had come to Chicago following his recovery from a serious illness, but was unable to attend the meeting due to a relapse.

The plan of organization and procedure, referred to elsewhere in this issue of *ELECTRIC RAILWAY JOURNAL*, was read, after which the chairman outlined briefly his views regarding the scope of the committee's activity. The addition to the personnel of the committee of members at large from the Pacific Coast, the state of New Jersey and the Southeastern district was suggested.

Mr. Lambert suggested that the proposed committee activities be given wide publicity during the next two or three months. He then spoke of the opportunity presented through this committee and through the committee on city operation for the manufacturers to co-operate. He suggested that various manufacturers designate certain of their district representatives to co-operate by bringing to the attention of the regional vice-chairmen any outstanding features or improvements observed. Mr. Lambert thought the regional vice-chairmen also might bring to the attention of the manufacturers many suggestions that would be help-

ful in stimulating activity on the part of the manufacturers in responding to the needs of the industry.

In the ensuing discussion it was pointed out that it must be demonstrated to member companies that the association is attempting through the work of this committee and the committee on city operation to advance the general interests of the entire industry. Since the idea is just at its inception a great deal of discussion was devoted to ways and means of obtaining the desired information and distributing it to the member companies. It was proposed to get immediate publicity through the technical press of outstanding developments or accomplishments found. The committee agreed that such publicity should be given in advance of the committee's annual report where particularly interesting information was obtained by the regional vice-chairmen.

It was agreed that Chairman Reid would write to the manager of every interurban railway in the country advising him of the organization, plan and procedure outlined for this committee work.

President B. I. Budd, who was present at the afternoon session, expressed his appreciation to the chairman and the members of the committee for accepting the responsibility of this work. He said that he felt the help which could be rendered the industry was incalculable. Mr. Budd declared that the interurban situation was not so serious as many people thought. "I believe," he said, "that the erroneous impression regarding the situation in general is due largely to the lack of information or to the dissemination of much misinformation. A great deal of publicity is given to the weaknesses of the industry, but very little to its accomplishments." Better apparatus and tools and the more intelligent use of every known development and improvement require the dissemination of information in such shape that the application of these methods may be known to every one in the industry.

Another feature of the work discussed by Mr. Budd was the opportunity for the vice-chairmen to become acquainted in their visits with young men who are capable of development as future leaders. He suggested building up a list from which future committee men might be selected, and felt that the committee work would assist in developing these young men for the companies and for the industry, and thereby make available a flow of young men for positions of responsibility.

There was a general discussion of the relation of the motor vehicle to the industry and it was pointed out that the committee should direct its attention to this phase of the transportation problem.

Mr. Lambert suggested that the committee study the possibilities of the organization of holding companies to finance the purchase of equipment and establish central maintenance plants. He stated that his company would be

glad to place at the disposal of this committee and the committee on city operation its experts on freight haulage and on shop practice.

Mr. Blanchard felt that there has been too great a disinclination on the part of managers to establish proper and friendly contact with the newspapers, which in his opinion are the best media in a community to establish direct contact with the general public.

He urged companies whenever they have real news to give it to the newspapers, but advised against the practice of attempting to secure free advertising by offering it to the newspapers as news. He urged a proper and reasonable amount of paid advertising by the companies. He suggested that the newspapers be used to acquaint the public, particularly in the small communities, with the companies' employees. He also suggested that the companies tell the public through the newspapers how its money is being spent in the communities and show what a large percentage of its receipts are returned to the community in wages, material and other items.

Definite Educational Plans Prepared

AT THIS year's meeting of the committee on education of the American Association, held in New York Dec. 18, the assignment of the executive committee was interpreted to instruct the committee to prepare an elementary text on electric railway economics. This the committee definitely plans to do if a way can be found to finance the undertaking. The proposed material will serve as a text for instruction in the fundamentals of electric railway service, aside from operating and mechanical considerations. These will form the basis for later plans.

The committee will at once canvass the field to learn, through the co-operating educational directors, what is now being done along educational lines by member companies.

A booklet will also be prepared for wide distribution among employees, to stimulate interest in education. This will be done with a view to impelling each employee to ask himself whether he is making the best use of the educational facilities already within his reach if he will but make the effort to utilize them.

Those present at the meeting were: Edward Dana, Boston, chairman; W. J. Edmunds, Pittsburgh; A. L. Hodges, Brooklyn, representing C. E. Morgan; A. T. Koehler, New York, National Industrial Conference Board; Myles B. Lambert, East Pittsburgh; H. H. Norris, New York; J. V. Sullivan, Chicago; Prof. W. H. Timbie, Boston. Messrs. Dana, Lambert and Executive Secretary J. W. Welsh were appointed as an executive sub-committee to inaugurate the plans of the committee as promptly as possible, and to Mr. Norris was assigned the duty of receiving suggestions as to the booklet and putting them into concrete form.

Chase Hotel, St. Louis, Where Midyear Convention Will Be Held

Publicity for Midyear Meeting

PLANS are already under way in making arrangements and securing publicity for the Midyear Meeting of the American Electric Railway Association, to be held in St. Louis on March 4. Col. A. T. Perkins, general manager United Railways of St. Louis, is chairman of the publicity committee, which has made arrangements to secure adequate recognition for the convention. St. Louis welcomes the convention for many reasons. It calls itself the "city surrounded by the United States." With the terminals of twenty-six railroads reaching all parts of the country it is the gateway to the South and Southwest.

Among its many advantages, the city especially prides itself on its electric railways. The United Railways, which has been in receivership for some years, has now advanced to a position where the Federal Court and the Public Service Commission believe that the time for reorganization and resumption of control by the owners is at hand. The company also has the important matter of several franchise renewals on hand on the east side of the Mississippi River.

On the Illinois side also, East St. Louis is a greater industrial center than St. Louis itself. It is served by the lines of the East St. Louis & Suburban Railway and affiliated properties under the leadership of President W. H. Sawyer, who also is chairman of the committee on arrangements for the dinner. The lines of this company terminate at the west end of the Eads Bridge at Third and Washington Avenues, St. Louis. With characteristic foresight, President Sawyer already has announced that the badge of any one attending the Midyear Meeting will serve as a pass on the east side line. The McKinley lines, now absorbed by the Illinois Power & Light Corporation, have a terminal in St. Louis at Twelfth and Lucas Avenues in the heart of the business section, reaching it by means of the McKinley Bridge over the Mississippi. On the Illinois side, these lines serve Granite City, Venice, Wood River and Alton on the line to Springfield, Peoria, and other Illinois points.

The city is looking forward with great interest to the Midyear Meeting.

The Hotel Chase, St. Louis, Mo., where the Midyear Meeting is to be held, "in its appointments, furnishings, and beautiful settings is as beautiful as any in America," according to Mr. Sawyer. A street car line extends to the door of this hotel, which affords direct connection with the downtown business district in less than twenty-five minutes.

The Palm Room, in which the banquet will presumably be held, is large enough so that 950 persons can be seated with clear vision of the speakers' table. There is also the Crystal Ball Room with a seating capacity of 600, and an inclosed roof garden with a seating capacity of 600; the former probably will be the room used for the business meetings.

News of Other Associations

Midwest Association to Meet

THE Midwest Electric Railway Association will hold its next quarterly meeting at Springfield, Mo., January 17. There will be a morning and afternoon business session, at which several papers will be read, and a banquet in the evening with several prominent speakers. This association is composed of executives and operating officials of Missouri, Kansas, Nebraska, Oklahoma, Colorado and Arkansas.

New York Electric Railway Association

AT A meeting of the executive committee of the New York Electric Railway Association, held last week, the date of the midyear meeting was set for Thursday, Jan. 24. The meeting will be held in the Commodore Hotel, New York City. The morning session will begin at 10 a.m. There will also be an afternoon session and an evening dinner, also at the Commodore.

Wisconsin Utilities Convention.—The 1924 convention of the Wisconsin Utilities Association, will be held April 17 and 18 at the Hotel Pfister, Milwaukee.

Maintenance of Equipment

Safety Shoe for Shop Ladder

LADDERS used in the shops of the Chicago Surface Lines are equipped with "safety shoes" of the type shown in the accompanying sketch, to prevent slipping on the concrete floor.

These shoes are made up in the shop and consist of a U-shaped bracket of $\frac{3}{8}$ -in. thick steel riveted

This Shoe Prevents Ladder from Slipping on Concrete Floor

to a flat plate $2\frac{1}{2}$ in. wide by 6 in. long. A maple block $\frac{5}{8}$ in. thick is bolted to the bottom of the plate and $\frac{1}{2}$ -in. x 1-in. rubber pads are screwed to this block. This arrangement always brings the full area of the ladder footing into contact with the floor and the rubber further prevents slipping.

Soldering Contact Tips on M. U. Switch Group

A METHOD of fastening contact tips to the stationary contacts of switch group control on multiple-unit control cars has been worked out at the shops of the Metropolitan West Side Elevated Railway, Chicago, and has resulted in longer life to the contact tips with fewer failures of this particular part of the switch group mechanism. The contact tip is tinned on the under side after being formed to fit the stationary contact. The stationary contact is likewise tinned, and after the

machine screws which ordinarily hold the contact tip in position are driven home, the assembled contact is heated and the two parts thus sweated together.

At the time the stationary contact is tinned, sufficient solder is used to fill up the counterbored hole into which the cable lugs are screwed. This holds these lugs securely in position and prevents arcing at the point where the lugs screw into the stationary contact.

This method of fastening the contact tip has made possible the wearing of the tip down to a thickness which previously could not be allowed on account of the warping of the tip and the consequent holding of arcs when the circuit is broken. This arc, although held down to a minimum by this new method, has in the past proved rather disastrous to arc boxes or arc shields on the switch unit. These shields are made of $\frac{1}{8}$ -in. transite, and considerable pitting and burning has been experienced. To eliminate this trouble the transite is soaked in oil, waste oil from the control cylinders being used, and the arc appears to slide over rather than pit the shield.

Convenient Tool for Cutting Dust Guards

BY J. T. PORTER

Master Mechanic North Texas Traction Company, Fort Worth, Tex.

THE Northern Texas Traction Company uses standard wood dust guards for its journal boxes, and has found the tool shown in the accompanying illustration of particular service for cutting the holes accurately. It is provided with a shank with the upper part arranged to fit the particular boring machine or drill press which is to be used. The lower part of the shank has a slot in which a right-angle cutting arm fits. The cutting arm is held in position by a set screw after being adjusted to the proper location for the hole which is to be cut. In making the tool, care should be taken to see that the set screw does not work loose. A good method is to counter-sink the arm where the set screw

strikes it and then to use a locknut against the shank. The lower end of the shank is provided with a quarter-inch twist drill for accuracy in setting and to give a bottom support that will prevent vibration.

Previous to the use of this tool, the old method of cutting the holes in dust-guard boards was to mark off

Tool for Cutting Journal Box Dust Guard

the hole and then saw out the circle on a bandsaw. With this method the outer part of the board has to be cut through to get inside and make it possible to saw the circle. This cutting through the outer part of the board weakens the dust guard and frequently results in breakage. It was also almost impossible to saw out the circle accurately, and as a result when the board was slipped over the shoulder on the axle there would be open places that would let in dust.

Another method of cutting the holes which was tried without success was to clamp the board in a chuck of a speed lathe and turn the hole out. This is a great improvement over the sawing method, but difficulty was experienced when the hole was being turned from the pressure of the chuck jaws. This pressure caused the wood to spring somewhat so that when the board was finished and removed from the chuck it would

spring back and the hole would be slightly oval in shape.

By use of the tool shown in the accompanying illustration, dust guards for journal boxes can be cut on either a boring machine or a high-speed drill press. All that is necessary to hold the board in place on the bed of the machine is a clamp that will keep the board from turning or rising. The holes will be cut to exact size and will be entirely true. The use of this tool has shortened the time of cutting the holes in these boards at least 50 per cent over previous methods used. In cutting the holes better success was had by revolving the tool at a high rate of speed, as a cleaner cut hole is formed.

Increasing Trolley Wheel Mileage*

ALTHOUGH the trolley wheel is a very small part of a street car, it plays a very important part in its operation, and much time and money have been spent in perfecting current collectors. Some companies have found trolley shoes superior to the trolley wheel, but the experiments of the El Paso Electric Railway with several different trolley shoes were unsatisfactory and did not give the results which have been obtained with the trolley wheel.

The company states that its trolley wheel mileage record surpasses that of any other company in Texas, and for the past four years has been as shown in the following table.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

Year	Miles per Trolley Wheel
1919	14,000
1920	18,000
1921	20,000
1922	22,000
1923 (based on seven months operation)	23,000

The company considers that this record is due largely to the fact that an expert trolley man is kept, who does nothing but supervise and inspect trolleys. They are carefully inspected each 2,000 miles, and if they show the slightest defect they are removed and placed in first-class

condition before again being put into service. At every inspection the tension of the trolley base is tested with a special weight made for that purpose, and in this way the bases are kept at uniform tension. When the trolley wheels show the least sign of wear they are removed and sent to the machine shop, where a new groove is turned. Another reason for the large mileage is the fact that the overhead is kept in first-class condition.

New Equipment Available

Pipe and Bar Bending Machines

SEVERAL machines for bending pipes, bars and structural iron have recently been placed on the market by the Wallace Supplies Manufacturing Company, Chicago, Ill. One line operated by belt drive consists of the types 5-B, C, D and E. These machines are practically the same, except that they are arranged so that different tool equipment can be used. The 5-B machine is arranged with suitable tool equipment for bending pipes or tubes, but separate tool equipment can be furnished so that angles, channels and other shapes can be bent on this machine. This line is intended primarily for use in bending tubing, electrical conduits, water, gas, steam and air pipes up to 2 in. diameter and for bending bars or structural shapes with 2 in. as a maximum dimension.

These machines are operated by

throwing a friction clutch into engagement by means of a lever and can be operated either forward or reverse. Adjustable stops are provided to suit any degree of bend required. The clutch is automatically thrown out of engagement at both the end of the bending operation and when the machine has been reversed to the starting position. The fixtures for pipe bending provide for securing the pipes to the forms by means of a strap. Both the outside follower and the form are grooved with the proper clearance to secure the desired results. The outside follower bar operates between the tube and the roller, instead of the roller working directly on the tube. This method supports the tube for a greater distance and prevents flattening.

Special forms with inside follower bars or floating mandrels can be furnished for bending light-gage tubing to a short radius without danger of flattening or crimping. Heavier

At Left, Belt-Driven Pipe Bending Machine. At Right, Power-Driven Machine for Bending Larger Sizes of Pipes and Structural Shapes

gages of tubing than $\frac{1}{8}$ -in. wall can be formed by using the outside follower bar only and dispensing with the mandrels for supporting the tubes on the inside during the process of bending.

The No. 15 Wallace bar-bending machine is used for bending cold metal bars of 1 in. diameter or 1 in. square, flat shapes $\frac{3}{4}$ in. x 2 in. on edge or flatwise, and angles 2 in. x 2 in. x $\frac{1}{4}$ in. The machine can also be used on hot bending work $1\frac{1}{2}$ in. squares or round, also flat shapes $\frac{3}{4}$ in. x 2 in., and angles $2\frac{1}{2}$ in. x $2\frac{1}{2}$ in. x $\frac{1}{8}$ in.

An adjustable stop mechanism is provided on the underside of the machine for automatically stopping and rotating the table at any predetermined point, so that materials can be bent exactly to any desired number of degrees. The speed of the rotating table is 6 r.p.m., the production varying according to the number of degrees that the material has to be bent, the length and kind of stock and also the size of the sections. A fair average production estimate for ordinary cold bending to 180 deg. is 150 pieces per hour, based on rounds, squares and flats bent flatwise.

The No. 8 Wallace machine is power driven and is of very sturdy construction. It was designed primarily for bending of reinforcement bars as large as $1\frac{1}{4}$ in., but the machine has ample power to bend two of these bars at a time and in this way production is increased. The machine can also be used for bending angle iron and for bending pipes of all sizes up to 4 in. diameter. The No. 8 bender will produce from fifteen to twenty bends per hour.

Improved Vertical Drilling Machine

THE accompanying illustration shows a 20-in. vertical drilling machine which has recently been redesigned and improved by the Superior Machine Tool Company, Kokomo, Ind. The improvements include bronze bushings, back gears, geared feeds, and wheel and pilot feeds. Particular attention has been given to a demand for a drilling machine for jobbing work.

The housings for the bearings are bored to standard dimensions, and the bushings which fit in these may be easily removed and replaced when worn. The spindle sleeve is made of cast iron, bronze bushed, and is graduated the full length of its

New 20-In. Vertical Drilling Machine

travel. The stop collar is arranged to allow for maximum travel without removal. The column is well proportioned and is reinforced at sections subject to heavy strain. A 2-in. belt and pulley and $2\frac{3}{4}$ -in. belt on the counter pulley are used for driving. This gives all necessary power for drilling within the capacity of the machine. Ample provision for lubrication is afforded for all working bearings. As shown in the illustration, this machine is belt driven, but it can be adopted for motor drive, with motor speeds varying from 750 to 1,800 r.p.m.

The table is reinforced by sectional ribbing and also has a large supporting shoulder on the hub, to

give additional stiffness when drilling at the edge of the table. The height of the machine to the top of the pulley is 74 in., the spindle being 41 in. from the base. The distance from the table to the spindle is $25\frac{1}{2}$ in., the traverse of the spindle sleeve $8\frac{1}{2}$ in., and the traverse of the table $23\frac{1}{2}$ in. This machine drills on the center of a 20 $\frac{1}{2}$ -in. circle. Six spindle feeds from 0.005 to 0.018 in. per revolution are available.

When belt driven, a driving pulley 9 in. x 3 in. running at a speed of 450 r.p.m. is used. This gives four direct spindle speeds from 971 to 875 r.p.m. and with the back gears in four additional speeds from 25 to 226 r.p.m. can be obtained. A 1-hp. motor is required if the machine is to be motor driven.

Rigid Shaft Connection for Track Grinder

A MACHINE for emergency work and for grinding the grooves of special trackwork has recently been developed and is being marketed under the name of the Vulcan telescopic shaft grinder, by the Railway Trackwork Company of Philadelphia, Pa. The principal feature of this grinder is the shaft connection, which is a square steel tube connected to the motor and grinder shaft by universal joints. The manufacturers claim that there is less danger of trouble and less breakage of shafts from this type than with the flexible shaft equipment. By using universal joints at each end of the telescopic shaft sufficient flexibility is obtained for the usual operations of grinding encountered on tracks and in electric railway shops. The apparatus weighs approximately 400 lb.

The News of the Industry

One-Man Car Trial

Berkeley Will Use Equipment for Six Months—Oakland Fight Not Making Progress

Through its Council the city of Berkeley, Cal., has voted to put one-man cars on trial for a period of six months. The significance of this move is better understood when it is explained that at present there is an ordinance in that city which forbids operation of cars of this type; that Oakland, an adjoining city, has banned the one-man car, and that Oakland's Mayor sent a letter to the Berkeley authorities urging them to join with him in the war he is making on the San Francisco-Oakland Terminal Railways.

City Manager Edy and City Attorney Sanderson of Berkeley have been directed to prepare an amendment to the prohibiting ordinance, providing for a six months probation of the safety cars. The operation of the one-man cars in Berkeley will be limited to Ashby Avenue and Dwight Way.

The Council has also decided to permit the railway to operate buses in Berkeley at an annual fee of \$60 a bus. All other applicants who sought similar permission have been excluded.

CITY MANAGER APPROVES PLAN

The action of the Council was based on an exhaustive investigation conducted by City Manager Edy as a result of which he recommended that one-man cars receive a fair trial. He held:

1. Operation of one-man cars need not be objectionable from the standpoint of policing.
2. Use of one-man cars may be expected to delay traffic or to bring about traffic congestion only if such cars are used on heavily traveled lines.
3. Traffic delays incident to the use of safety cars can be materially reduced by adopting the San Diego system of collecting fares as passengers enter on inbound cars and as they leave outbound cars.
4. No extra hazards surround passengers riding in such cars.
5. Operation of one-man cars should bring about an immediate improvement in service on the lines where they are used and, as economies are introduced, the city is manifestly in a better position to request a review of the company's rates by the Railroad Commission.
6. The so-called "one-man, two-man cars" are superior to one-man cars. If permission to use the latter is granted and if such use proves satisfactory to the public, the former should be operated to the limit of their practicability in Berkeley.

Objection to the proposed amendment is voiced by the Housewives' League, which is threatening to call a referendum on the matter. This, however, has not as yet been definitely decided. Improvement clubs are generally expected to back the recommendation of the City Manager.

The controversy in Oakland over the use of the one-man car appears to have passed the acute stage, at least for the time being. Petitions are still being

circulated asking for a bond issue to settle the question of municipally operated buses, but the public seems indifferent. It is claimed that the necessary 6,000 signatures have been obtained, but on Dec. 11 the petitions were still in the hands of the circulators. Although the ordinance remains in effect that was passed against the use of the one-man cars in Oakland, cars of that type are still being run there.

In the meantime the city bus, the "Rosalie," continues to be operated by the city under the supervision of Commissioner Moorehead. An effort was made to purchase this bus, but the Council found a flaw in the ordinance, which specified that a "new" bus should be acquired. As the "Rosalie" was six weeks old at the time this ordinance was passed, a majority of the Council balked and the "Rosalie," although making official trips, is still only loaned to the city by the makers.

Mr. Moorehead recently announced that he had found funds among those of which he has control by which four new buses can be purchased. He has expressed the intention of asking the Council for permission to acquire these buses, but so far, he has failed to do this and the source of the funds which he proposed to use remains one of the deep mysteries of Oakland.

Making Plans for Railway Continuance in Massachusetts

In view of the court decree which calls for cessation of service on the Connecticut Valley Street Railway system, operated by a receiver, by March 1, a movement is under way to form a citizens' company in Northampton to buy the lines running from that city to Amherst and Hatfield. The Northampton Street Railway officials, while stating that they had no intentions of taking over these lines on their own behalf, have indicated that they might be willing to operate them under some arrangement with the prospective owners. In respect to the Greenfield and Turners Falls line no interest has been exhibited in the matter of arrangements to continue the road in operation, the residents apparently being resigned to the prospect of bus operation.

On the Northern Massachusetts system, active interest is being taken in Athol, Gardner and Templeton, in the plan to command local capital to purchase and operate stretches of road serving these communities. These plans are ordered with a view to buying the physical properties at a sufficiently low price to start the project on a paying basis. Service on the section running between Winchendon and Baldwinville was discontinued on Dec. 15.

New Contract Proposed

Cincinnati Committee Contends that Relations of Railways with City Are Discordant

Abrogation of the Cincinnati Traction Company's franchise and the awarding of the company with a new contract with no "entangling alliances," together with a fare not to exceed 7 cents and improved service for the car riders, are the outstanding recommendations in the report of Mayor George P. Carrel's traction committee, made public on Dec. 15. The report will be submitted to the City Council before Jan. 1 for ratification. The committee was appointed two years ago by Mayor Carrel to study Cincinnati's traction situation.

SIMILAR PROPOSAL MADE BEFORE

The proposals are similar to those offered in April, 1921 by W. C. Culkins, formerly Director of Street Railroads. At that time Mr. Culkins recommended that the service-at-cost franchise under which the traction company operates be abrogated. The Mayor's committee further recommends that the traction company be compelled to pay the cost of repairing that portion of the street along the rails for a distance of 2 ft. outside and between the rails. The committee also suggests that the aggregate capitalization of the Cincinnati Traction Company, Cincinnati Street Railway and the Cincinnati & Hamilton lines be reduced from \$39,000,000 to \$25,000,000; that the earnings of the traction company be limited to 6 per cent on the \$25,000,000, and that the traction company be required to surrender its jurisdiction over all other activities in which it is involved and devote its entire energy to the operation of its electric railway system. Another provision suggested is that net earnings exceeding 6 per cent on the capital be applied to cut fares.

The Mayor's committee said it had reached the conclusion that the differences between the Cincinnati Street Railway and the Cincinnati Traction Company were irreconcilable. The report criticises the existing franchise, which it says is a partnership between a public body and a private enterprise, saying it has failed utterly of its heralded results at the time of its adoption. The Cincinnati Traction Company took over the local electric railway system from the Cincinnati Street Railway under a fifty-year lease in 1901.

It is pointed out that instead of fares being reduced or held at a specific rate they have advanced and the prospects are for indefinite advances. Along with this, the report says, there has been a steady decline in service.

The recommendations of the Mayor's committee were approved by the entire membership.

The committee found:

1. The mutual relations between the Cincinnati Traction Company and the Cincinnati Street Railway and the city of Cincinnati are discordant and lacking in necessary co-operation and harmony.
2. Maintenance of the traction properties has been deferred year by year until the accumulation of deferred maintenance will require from \$2,000,000 to \$4,000,000 to absorb.
3. The Cincinnati Traction Company has activities other than the transportation of people over the streets of the city.
4. The aggregate capitalization of the street railway properties in this city is excessive.
5. The service given to the public in the operation of the car lines is grossly inadequate and unsatisfactory.
6. The rate of fare, considering the service rendered, is unreasonable and excessive.

The committee recommended that:

1. The now existing contract of the city of Cincinnati, known as the service-at-cost franchise, be rescinded and abrogated.
2. A new franchise be offered, which shall provide among other things:
 - (a) A reduction in the aggregate capitalization of both the Cincinnati Traction Company and the Cincinnati Street Railway, including the Cincinnati & Hamilton lines, from approximately \$39,000,000 as now claimed, to a sum, which including stocks, bonds, debentures, car certificates and all other forms of indebtedness, and such sum as shall be necessary to rehabilitate the system, or to so improve it as to assure first-class service, shall not exceed \$25,000,000, and to which shrinkage and reduction both the companies should contribute.
 - (b) A provision limiting the rate of fare to a maximum of 7 cents based on present operating costs, with a further provision that net earnings exceeding 6 per cent on the capital investment, as above recommended, be reflected in diminution of fares.
 - (c) A cessation on the part of the operating companies of all activities save the operation of cars and the transportation of the passengers over the lines within the city limits and territory immediately contiguous thereto.
 - (d) A provision constituting a sum sufficient to take care of the cost of the repairing of that portion of the streets along the rails of the operating company to a distance of 2 ft. outside and between the rails, and that the same be a preferred charge against the earnings of the operating company.
 - (e) A provision to the effect that any order of the Director of Street Railroads, or other authorized city official, to the operating companies, shall be presumptively reasonable and to be complied with within the time specified in the order, unless declared by a court of competent jurisdiction to be unreasonable or confiscatory.
 - (f) The city officials in every department to take at once the necessary steps to compel a compliance with the above recommendations.

Americans Organize Company to Develop Foreign Utilities

Announcement was made on Dec. 18 by the Electric Bond & Share Company, New York, N. Y., of the incorporation in Maine of the American & Foreign Power Company, Inc., which will enter the public utility field of Cuba, Central America and South America. The organization of the new company, which marks the first time that American hydro-electric enterprise has been extended on a large scale into foreign countries, was effected by the Electric Bond & Share Company, the common stock of which is owned by the General Electric Company.

The president of the new company will be S. Z. Mitchell, who is also president of the Electric Bond & Share Company, and the following will be directors: Owen D. Young, chairman of the

directors of the General Electric Company; Anson W. Burchard, president of the International General Electric Company; Clarence Dillon of Dillon, Read & Company, and Charles E. Mitchell, president of the National City Bank.

The ground work of the new company consists of a number of public utility companies acquired in the last few years by the Electric Bond & Share Company in thirty-nine communities in Cuba, Panama and Guatemala. Some of the more important are hydro-electric companies serving Santiago, Cienfuegos, Cardenas, Santa Clara and Camaguey in Cuba; the Panama Power & Light Corporation, which controls several important power units in Panama, and the chief power companies in Guatemala. Among these properties are included one or two electric railways. These will be developed so as fully to meet the needs of the territory they serve, but the plans of the new company do not now contemplate entering this field with new enterprises.

Community Chest Helped by Railway Employees

When the drive of the Allied Charities of Kansas City, Mo., and the Community Chest of Kansas City, Kan., was conducted, from Nov. 5 to 10, none of the institutions of Kansas City responded more quickly or more generously than the employees of the Kansas City Railways. The men and the women who make up this organization were among the first to go over the top.

In former years outside committees have solicited the employees, but this was not satisfactory, so this year committees to handle the work were appointed in every division and at all departments on both the Missouri and Kansas sides and each committee in turn elected its own chairman or captain. Actual work was started by the committees on Nov. 1. The motto was: "A Day's Pay for a Year's Charity." The goal was 100 per cent subscribers from each member of the organization. Each evening the captain of each team telephoned his report to the secretary of the company, who tabulated the records and sent out daily bulletins showing the standing of the various divisions and departments.

Within six days the grand total of their efforts for the benefit of charity resulted in 3,290 employees subscribing \$13,822.40, an average of \$4.20, a record that no other organization in Kansas City bettered.

Vacancy for Engineer.—The United States Civil Service Commission announces an open competitive examination for assistant electrical engineer (power plant). This examination is to fill a vacancy in the Quartermaster Corps of the Army, Philippine Islands. Receipt of applications will close on Jan. 15.

Wage Plan Subject of Association Meeting in Philadelphia

One of the outstanding events of the annual meeting of the Co-operative Welfare Association of the Philadelphia Rapid Transit Company was the suggestion made by Dr. Arthur A. Mitten, secretary of the association, that a new wage plan should be put into effect based on the purchasing power of the dollar. Dr. Mitten's plan was announced following a recommendation by Ralph R. Nyman, retiring head of the association, that some new method for adjusting wages was needed to replace the so-called "three-city plan," which, he said, was made effective as a war-time measure and had outlived its usefulness.

Mr. Nyman said that since men and management are in Philadelphia together accomplishing more than was being done elsewhere it was not just that their wages should be governed by conditions in other cities. He said that 99 per cent of the men had agreed to accept a 65-cent rate, refunding the 2½ cents to the co-operative wage dividend fund, the present wage being 67½ cents. At the end of the year each worker is credited with 10 per cent of his year's wages in this dividend account, which brings the effective rate from 65 cents to 71½ cents an hour. Mr. Nyman announced that \$3,300,000 in stock was held by the workers in the wage dividend fund. In addition, the Welfare Association owns 10,000 shares and the association itself, which administers sick benefits, has a membership of 99.96 per cent of eligible members. Mr. Nyman further said that the helping hand fund had distributed \$30,000 to needy employees and that the savings fund had passed the \$2,000,000 mark.

Dr. Mitten referred to the "three-city average" and said that during the war, when agitators sought to arouse trouble by contending that the wages were lower than the union scale, the company was in a defenseless position, because of the existing man shortage, and in order to avert the attempted strike planned to secure government intervention. It adopted the War Labor Board's wage rate decision for certain so-called first-class unionized cities and made this the basis for adjustment of employees' wages in all departments of the company.

He referred then to the determination of the company that beginning Jan. 1 of next year the basic wage rate would be 65 cents. He said that this wage assured the continuation of the present standard of living, which was better than heretofore experienced. He said in this connection:

"We should, therefore, in these prosperous days so plan that we be not overtaken by adversity when business depression makes decreased wages necessary."

The new wage scale, which is effective Jan. 1, 1924, was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Dec. 15.

Virginia Property Relieved of Paving Between Tracks in Portsmouth

The State Corporation Commission has relieved the Virginia Railway & Power Company of the duty of paving between its tracks in Portsmouth. A counter action was overruled which had been brought by the city of Portsmouth, holding that the commission had no right to disturb a contract between the city and the company.

The case, the first of its kind in Virginia, arose not long ago when the city of Portsmouth decided to pave its principal street, a wide thoroughfare, and served notice on the railway that it would be expected to pave between its tracks and 2 ft. on each side of them, according to the contract with the City Council. The railway took appeal to the Corporation Commission, on the grounds that the property was not a paying investment and that the company could not be forced to expend funds for this work when the property was being operated at a loss.

Jurisdiction was the principal question before the commission, and that body decided that no city could enter into a contract prejudicial to the welfare of all. The principle of the decision is that the Commonwealth is greater than any of its political subdivisions. The commission held that there was no valid contract obligation on the company with respect to the alleged duty of paving and that even if there were such a contract the state had the power, with the consent of the company and over the protest of the city, to suspend such duty. It therefore overruled the demurrer of the city of Portsmouth.

Pointing to the fact that the company's losses from operation last year were about \$100,000 and that the paving bill would be in the neighborhood of \$175,000 (estimated), the commission decided that to impose this heavy burden upon the power company "under present conditions would be unjust and unfortunate; unjust to the power company and unfortunate to the public whose needs the company is designed to serve."

The commission states that the decision is on the merit of the proposal, and does not mean that similar action will be taken in other cases.

Ruling Rendered on Service Extensions.—Asserting that the Wisconsin Railroad Commission is without authority to order extensions of public utility services in municipalities, the Wisconsin Supreme Court affirmed the decision handed down recently by a lower court at Madison in the case of the state vs. the Washburn Water Works Company involving municipal or commission jurisdiction over municipal water main extensions. The Wisconsin Supreme Court in its latest decision held that authority to demand extensions and impose penalties for failure to comply with orders

of the commission is vested in the municipality and not the commission. This ruling is regarded as likely to have an important bearing on railway extensions requested by municipalities.

M. O. Agitation Renewed

Messrs. Witt and Hatton Want to Take Over Cleveland Railway—Consummation of Plan Unlikely

Talk of municipal ownership of the railway system is again going the rounds in Cleveland.

Under the service-at-cost franchise with the Cleveland Railway the city has the option to purchase the property at any time by the payment of \$110 a share for the stock. This stock is now selling in the market for about \$95 a share. Inasmuch as there is approximately \$30,000,000 par value of stock outstanding, with an additional \$5,000,000 par value of bonds, it would require a bond issue of about \$38,000,000 for the people of Cleveland to purchase the property.

The talk of municipal ownership was started recently because of the fact that Cleveland on Jan. 1 begins the city manager form of government, and Peter Witt and Prof. A. R. Hatton, two of the newly elected members of the City Council, are both avowedly in favor of municipal ownership of the Cleveland car system.

Following declarations by Prof. Hatton and Mr. Witt that they favored purchase of the railway lines, John J. Stanley, president of the Cleveland Railway, said he was agreeable to the city purchasing the lines at any time if the stockholders were paid \$110 a share as called for by the option in the franchise.

On Dec. 17 Councilman John Sulzmann introduced a resolution calling for a bond issue sufficiently large to purchase the Cleveland system. This resolution was defeated in the City Council, but on a move to reconsider it is now in the hands of the street railway committee of the Council, where it will die with the present Council this year. Councilman Sulzmann's action was evidently taken merely to beat an expected move on the part of Councilman-elect Hatton after the first of the year.

During the life of the service-at-cost franchise in Cleveland, there have been two efforts in City Council to have the city purchase the lines. Both were defeated as was a proposition put up to the people of the city by the socialist party.

Most political leaders are of the opinion that any effort to bond the city for \$38,000,000 to \$40,000,000 for the purchase of the lines by the city would meet with defeat. It is the general belief in Cleveland that the service-at-cost franchise, with the City Council dictating the kind of service to be given, affords the people of Cleveland practically all the advantages of municipal ownership with none of the drawbacks inherent in such ownership.

Officials of Brooklyn Company Agree to Modification of Transit Plan

Gerhard M. Dahl, chairman of the executive committee of the Brooklyn-Manhattan Transit Corporation, has consented to accept a subway extension instead of an elevated structure as a means of ending the deadlock which has prevented the extension of the Fourteenth Street-Eastern subway from Meserole Street, Brooklyn.

The dual subway contracts called for an elevated structure for that part of the line, and the refusal of Lindley M. Garrison, formerly receiver of the old Brooklyn Rapid Transit Company, to permit the substitution of a subway brought about the deadlock, the Board of Estimate refusing to build an elevated line.

Mr. Dahl said that the directors of the company on the report of a special committee, composed of Robert Albert Shaw, Arthur S. Somers, Travis H. Whitney, William S. Menden, president of the company, and himself had agreed that the three projects should be considered as a unit under this program:

1. Dual subway contract No. 4, signed March 19, 1913, is still binding between the city of New York and the company. Under this contract the city agreed to construct the Fourteenth Street-Eastern line. This has not been completed. We are ready, however, to operate this line whenever the city finishes the work. We have been asked whether we will consent to a change in our contract so that the eastern portion may be constructed as a subway. As the public demand for this change evidently expresses the public need, we will agree to this change in the contract provided our present legal rights and claims are adequately preserved and the subway is constructed under plans which will connect it with our existing structures at East New York, but we wish to point out to the public that this company expended years ago, in anticipation of the early completion of this line, approximately \$500,000 third-tracking the Myrtle Avenue elevated, which includes an express station at Wyckoff Avenue to connect with the Fourteenth Street-Eastern line. This expenditure will be wasted unless facilities are provided for the convenient transfer of passengers between the Fourteenth Street line and the Myrtle Avenue line at this point.

2. The second plank in our program of action is the construction of the Nassau-Broad Street line. This is also an unfulfilled part of Contract No. 4. The B.-M. T. is ready to equip and operate this line as soon as the city constructs it. Furthermore, as a part of this contract the city agreed to build shops and yards. These are urgently needed in order to maintain even the present service. When the Nassau-Broad Street line is built and the Fourteenth Street-Eastern line is completed, the present 50,000 daily victims of the Canal Street blockade will receive the direct relief which they demand and need.

3. The third plank relates to the proposed connection between the Fulton Street "L" and the Fourth Avenue system at Ashland Place. The B.-M. T. is entirely willing to sign a contract for the Ashland Place connection as soon as it has definite and tangible assurance that the city will construct and complete the Fourteenth Street-Eastern and the Nassau Street lines.

Increased Pay for Inspectors.—The compensation for first grade inspectors (road inspectors) in the employ of the Municipal Railway of San Francisco has been increased from \$165 to \$185 a month, effective Nov. 16. At the same time the salary of day dispatchers was increased from \$175 to \$195 a month and of night dispatchers from \$165 to \$185 a month.

Babtiste and Beard Honored

C. A. Babtiste and W. K. Beard, advertising managers of the *ELECTRIC RAILWAY JOURNAL* in New York and Philadelphia territories, respectively, were the guests of honor at a dinner on Dec. 17 at the University Club, New York. The occasion was to celebrate more than a quarter of a century of service by them with the McGraw-Hill Company. The theme of the dinner was dependability. James H. McGraw was toastmaster and more than 100 guests, mostly members of the McGraw-Hill organization, gathered to pay tribute.

After introducing the guests of honor and reviewing briefly the history of their association with the company, Mr. McGraw presented each of them with a check for \$1,000, accompanied by a letter expressing his appreciation of their loyal, intelligent and dependable service.

Summoned from Philadelphia at almost the last minute, Mr. Beard was so completely taken by surprise that he said he found it difficult to express adequately his appreciation of the event.

Mr. Babtiste spoke brilliantly about the meaning of the publishing business to him and about the work of the company as an avocation for young men. He said that a publishing house to be successful as the McGraw-Hill Company has been could go forward only on the basis of "Service, more service and still more service."

During the evening L. W. Seeligberg, formerly business manager of the *ELECTRIC RAILWAY JOURNAL* and now in business for himself, was presented with a gold watch as a token of appreciation from his former associates.

The dinner happened to be on Mr. McGraw's birthday and the occasion was seized upon by his associates to surprise him with the gift of a handsome watch and chain.

Indiana City Seeks to Buy Three-Mile Railway

The city of Washington, Ind., has petitioned the Public Service Commission for authority to buy the Washington Street Railway, consisting of 2.6 miles of track, six cars and two trailers and other property. The city, the petition said, has a comparatively new \$140,000 electric power plant, which is equipped to provide current for the cars. The property of the company is assessed for taxation at \$36,840, it was said.

Moving Pictures to Win Public Co-operation

The Boston Elevated Railway has adopted a new plan to secure the good will of the public. It will bring all its troubles to the attention of the public. It has just established an information booth in the Park Street station, one of the most congested points on the system, to keep the passengers informed on car movements and delays

and suspensions and diversion of traffic routes.

In addition to this the company has adopted a movie film which shows actual incidents and conditions on the system that make for slower or interrupted service, and these pictures are to be shown in the theaters all over the district. The reel was shown in several houses in Boston this week. The picture presents the arrival of an irate passenger at one of the stations, greatly provoked by the fact that there is no car on hand to rush him into his office, for which he already is late. The starter is taken to task severely for such rotten service, and as the scene shifts from place to place the passenger learns about the open drawbridge, the breaking down of a motor truck, the traffic blockade at one point and a big fire at another and he learns about various other situations over which the company has no control, but which affect the service. At the end of the reel the irate passenger has become satisfied and congratulates the starter on doing so well with such handicaps. The public is expected to become more tolerant and give better co-operation after it has seen these pictures.

Company and Every One Else Celebrating.—Considerable interest is being shown in street railway circles in the celebration of its anniversary month by the Northeast Oklahoma Railroad at Miami. The company operates interurban service between Miami, Okla., and Columbus, Kan. The company is carrying a series of advertisements in the newspapers giving information as to payrolls, passengers carried, cars moved, freight handled, and asking for public support and patronage. All employees are soliciting business and suggesting routing of freight over the line that issues their pay checks. Posters in store windows proclaim the desire of the company to serve. A company orchestra is giving concerts and a general "open house" is being conducted by all departments of the company.

Extension Matter Given Hearing.—Hearing in the matter of the petition of the Mayor of Amsterdam, N. Y., for an order of the Public Service Commission to direct the Fonda, Johnstown & Gloversville Railroad to extend its lines into the Fifth Ward of the city, under the terms of a franchise granted in 1910, was further continued without opposition until Jan. 14 at Albany to enable the company to put in some additional testimony. Witnesses gave evidence concerning the cost of building and operating the proposed extension and the demand for trolley service in the Fifth Ward. Estimates were also given as to the revenues which would be received by the proposed extension

as well as the operating cost, the witnesses contending that such construction and operation would result in a loss to the company in its other operations in Amsterdam. City Attorney Fitz James contended that the company should live up to its franchise.

More Men to Receive Christmas Bonus.

—Payment of the 1923 Christmas bonus will be made to 1,916 trainmen of the Los Angeles Railway. The exact amount of money that will be paid has not been computed, but there are eighty-six more men to receive bonus this year than last year, the total last year being 1,830 trainmen. Special awards to be made to the ten top safety car operators and the ten top motormen and conductors of each division will range from \$10 to \$100. These awards are made in addition to the regular bonus, which is \$60, on a basis of \$5 per month.

Newspaper Praises Railway.—Once again the members of the Common Council of Binghamton, N. Y., will consider the advisability of granting the Binghamton Railway the right to charge a 6-cent fare within the limits of the city. Editorial comments in the *Morning Sun* of Binghamton under date of Dec. 5 would favor the 6-cent rate in view of the fact that the company kept faith with its promises made at the time the 6-cent fare was first proposed, namely, that new and better cars would be added and the company's service improved. The writer does not hesitate to add that residents in the city of Binghamton can find consolation in their 6-cent fare when compared with a 7-cent and 8-cent charge in various other cities.

Accident on Indiana Interurban.—Several persons were reported injured in a double rear-end collision of interurban cars on the Louisville, Ky., and Jeffersonville, Ind., connecting bridge during a fog on the morning of Dec. 17. It was reported that the first car, from Charlestown, Ind., had slowed down, when it was rammed by a regular car from Jeffersonville. The Seymour, Ind., car, also southbound, in turn rammed the car from Jeffersonville. The front and rear platforms of the center car were wrecked, but the other two cars were able to proceed on their own power. None of the three cars was derailed. The three cars are all under the operation of the Interstate Public Service Company.

Safety Measures Devised.—To supplement the crossing protection already maintained at the scene of the recent Twentieth Century Limited wreck at Forsythe, N. Y., the Public Service Commission on Dec. 14th ordered the New York Central and the Nickel Plate Railroads to give twenty-four-hour flagman service, and the Buffalo & Lake Erie Traction Company, operating a trolley line over the highway at this point, to bring all cars to a dead stop and then have the flagman cross the highway again to see there is no danger of an accident to highway users.

Foreign News

London Tube Collapses

A strange mishap occurred Nov. 27 in one of the tunnels of the City & South London Railway near the Elephant and Castle station. Just after a train had passed the ground above subsided and blocked the tube.

For some time work has been in progress of enlarging the railway tunnel, which hitherto had been smaller in diameter than those of the other tube railways. It is planned to make all of the tubes uniform in size, so as to permit through-routing and allow the interchange of equipment.

In the main the tubes that are now in regular operation by the companies in the city of London are driven through hard clay. It was necessary to remove the cast iron lining of the tunnel, excavate the necessary amount of material and place a new lining of increased diameter in the tunnel. The cause of the subsidence was the disturbance of the ground during the progress of this work in the vicinity of a large underground cavity. The whole of the railway has now been closed against traffic and will probably remain out of service for some time. Meanwhile, an augmented service of buses has been out on the route.

Subway Project Approved

The Municipal Council has approved the subway project in Argentina. The work of building the new lines that are now proposed will be undertaken by the concessionaire in the near future.

English Electrification Deferred

The plan of electrifying the main line of the Southern Railway's London, Brighton & South Coast division from London to Brighton has been indefinitely postponed, according to Sir Herbert Walker, chairman of the company. He stated that the heavy commitments in

the London suburbs, where traffic congestion is more serious, must be taken care of first. The plan for electrifying the main line would cost £10,000,000 and the directors of the company were not satisfied that it would prove a financial success.

Charge for Luggage on London Tube Railways

On account of the delay at stops, the London Underground Railways has begun charging for the conveyance of luggage or bulky packages. Where the ordinary single passenger fare is 5d. or under, the charge will be equal to the single fare, and where the ordinary single passenger fare is over 5d. the charge will be 6d. Passengers' personal luggage up to 14 lb. weight will be carried free.

Extent of Damage to Japanese Electric Railways by the Earthquake

Street Railway System of Tokio Lost 837 Cars and 50 Miles of Track—Much Other Damage Done in the City and Surrounding Territory Is Described

BY SHIRO SANO
Electrical Engineer, Tokio

THE sudden visit of the great earthquake on Sept. 1 left great damage to Tokio in various phases of metropolitan life, although the havoc wrought by the earthquake itself was not great compared with that due to the subsequent fire. The loss of life and property Tokio received at this time is the greatest ever experienced there, although the city has previously been visited by great earthquakes, on an average once in every century.

The street railway system of Tokio suffered a loss of nine substations, five car sheds, the main office and five branch offices, and 837 cars. About 100 miles of trolley and distributing lines and 50 miles of track were either burned down or disfigured by the quake. The total loss is estimated at about \$20,000,000. The damaged substations include two of 3,000 kw. each, one of 2,250 kw. and one of 2,000 kw. Fortunately, about 300 cars were saved and six substations were left intact, their outputs totalling 10,640 kw.

All the machines used on the system are either rotary converters or motor generators, except two sets of mercury rectifiers with a capacity of 550 volts, 900 amp. each, in the course of erection, which were burned.

The city has no generating station of its own, but purchases all of the energy, mainly from the Kinugawa Hydro-Electric Company. The damage to this company was slight and it was ready to supply electricity Sept. 4.

The operation of the street railway of Tokio was resumed Sept. 6 with a limited number of cars on a few routes only, but operations were gradually widened as the reconstruction proceeded. By Oct. 1 the track in use had increased to 89.5 miles, the number of cars running to 400, the number of passengers carried to 863,000, with total carfare of 38,771 yen (\$20,000). The greatest trouble in the way of reconstruction is the shortage of cars, although every step is being taken to build new cars and to repair those partly destroyed. Cars from other cities could not be used, owing to the 4-ft. 6-in. track gage of Tokio, which is a relic of the old-time horse cars. To provide for immediate service the city authorities decided to order 1,000 Ford automobiles to be used in conjunction with the electric cars.

Free service was offered from Sept. 6 to Sept. 17 to all passengers, but later this gratuity was limited to holders of "certificate of sufferer." From Sept. 26

Street Car Burned in Front of the Famous "Shiroki-ya" Department Store. At Right, Destruction on Ainsa-dori Street

No. 1. Many Cars Were Completely Burned in the Fire Following the Tokio Earthquake

No. 2. A Number of Bridges Collapsed Completely. The Men in the Foreground Are Military Engineers

on free rides were discontinued and new rates of fare put in effect. Before the quake a charge of 8 sen was made for a single ticket, and 15 sen for a return ticket, with free transfers. The fare has since been changed to 6 sen for single and 10 sen for return tickets, without transfer. This really is a kind of fare-raising in the guise of low rates. It is, however, to be abandoned as soon as the system recovers to normal. The reason advanced by the city officials for the change is the lack of facilities for printing transfers.

The street railway system of Yokohama was almost entirely burnt up and it was only on Oct. 2 that it began operation on a few routes with freight cars as passenger cars.

SUBURBAN RAILWAYS

The damage done to the suburban railways is comparatively small and most of the systems began their operation soon after the catastrophe. The Keihin Electric Railway received damages to two car sheds and its generating station, and lost four bridges. It began partial operation on Sept. 11, and on Sept. 17 resumed service on its entire system. The income increased greatly owing to the suspension of the parallel line between Tokio and Yokohama of the Imperial Government Railways, whose generating station was destroyed.

No. 5 All that Was Left of a Tokio Low-Floor Car

No. 3. The Line of the Keihin Electric Railway Was Destroyed by the Earthquake

The Tamagawa Electric Railway received no damage from the quake, but the purchased power supply of 3,000 kw. was stopped for a while. It was unable to operate until Sept. 8. The

No. 4. The Yuraku Street Substation Was Completely Guttered by Fire. This Is One of the Tokio Stations Lost

Keisei Electric Railway received only slight damage and began operation soon after the earthquake. It offered free service until Sept. 8. The Keio Electric Railway, the Oji, the Meguro Kamata, the Ikegami, the Chichibu and the Musashi railways received but slight damage and resumed operation within a short time.

The general tendency of the suburban railways is toward an increase of passengers since the quake. The reason attributed is the exodus of city dwellers to the suburbs, as their homes were destroyed by fire, and they were obliged to find accommodations outside.

A bureau of reconstruction was formed after the calamity and is busy in planning the new Tokio. According to the proposed plan the city will have a number of subways under the main streets. This is expected to facilitate greatly transportation in the future.

[From other sources it is learned that the total loss suffered by the electrical industry in Japan will exceed \$100,000,000, and it will require three to five years to restore pre-earthquake conditions. A portion of the photographs reproduced herewith are furnished through the courtesy of S. Hirota, chief editor of the *Ohm*, Kobe, Japan, and S. Yamazaki, chief engineer, Investigation Department, Tokio Electric Light Company.—Eds.]

Financial and Corporate

Valuation Appeal Argued

City Presents Its Case to Superior Court Seeking Relief from Commission Valuation Ruling

Argument was begun on Dec. 13 before the Superior Court of Pennsylvania on the appeal by the city for relief from the order of the Board of Public Utility Commissioners of the state upholding the 7-cent fare on the lines of the Philadelphia Rapid Transit Company upon a valuation of the company's which the commission fixed at substantially upward of \$200,000,000. The questions which the city says are involved in the appeal are:

1. Is the order of the commission reasonable and in conformity with law?
2. Is a valuation based on present reproduction cost correct?
3. Is the 1907 franchise contract between the railway and the city binding as to rates?

The city desires the Superior Court to remand the case to the commission with directions to reconsider the matter and decide it in conformity with law.

CONTENDS COMMISSION ORDER UNREASONABLE

The contention of the city is that the commission's order is vague and evasive and therefore not reasonable. The city holds that on its face the commission's order does not show enough facts to enable a reviewing court to check its correctness. In analyzing the difference between city and company figures on present reproduction cost the city says that the commission's order takes up only four items covering \$49,000,000, out of a total difference of \$103,000,000. The city contends, in short, that:

The commission makes a substantial allowance for going concern value and for economies in operation without stating the amounts. It fails to state a definite valuation. It is a determined effort to uphold the rate of fare created and instituted by the commission itself, without adequate reasons, published too hastily within ten days of the argument of a case of such magnitude, showing the 10,000 pages of testimony were not carefully weighed.

3. The valuation is based exclusively on present reproduction cost, which is not in conformity with law. The commission rejects all the city's figures on original cost and investment without consideration, and after comparing insufficiently the city and company figures on present reproduction cost now, concludes that as it would cost substantially upward of \$200,000,000 to reproduce the property today, that is its present value. This is contrary to the decision of the Supreme Court of the United States in the Atlanta Gas case, decided last June, which followed the Galveston Electric case of 1921. These cases decide that present costs must be given weight, but it is wrong to adopt them as the sole measure of value.

There are other errors of law in the opinion. The commission allows \$14,000,000, the cost of paving done by the company, calling it price paid for the franchise, when in fact the company itself carries its annual paving payment, of \$500,000 under the 1907 contract, as part of its operating expenses, and the commission has approved this practice. The commission allows \$13,000,000 for loss of fair return during early years of operation, when in fact the history of the property shows it was profitable from the start, earning an aver-

age of 12 per cent from 1861 to 1890. It allows \$17,000,000 for cost of financing, an item the Supreme Court of the United States decided inadmissible in the Galveston case. It rejects the city's investment figure of \$131,000,000 on incorrect grounds, as shown from the testimony.

The order is unconstitutional, as it impairs the obligation of the contract of 1907. That contract is binding. It was specifically authorized by the act of Assembly of April 15, 1907, which, under the decision of the United States Supreme Court in the Home Telephone & Telegraph case in 1908, gives it binding force. Even if the commission has power to alter rates fixed in ordinary franchise ordinances under the police power, that power does not extend to a contract like this, under which the city gave up valuable considerations in exchange for the rate promises made by the company.

During the presentation of the city's side by Samuel Rosenbaum, assistant city solicitor, Judge Keller interposed to remark:

They (the commission) evidently did not deem material the question of the actual value of the company's property as "upward of \$200,000,000" was sufficient to justify the establishment of the 7-cent fare as a proper return to the company.

There was no need for the commission in the circumstances to determine definitely exact values. How much more than \$200,000,000 the valuation should be would make no difference, as that valuation was sufficient to justify the present fare.

The case was concluded on Dec. 14 with the presentation of the argument of Frederick L. Ballard, counsel for the company. The court reserved decision.

Mr. Ballard said that the fare paid in Philadelphia is justified by the high quality of the service rendered, irrespective of what is the fair value of the property of the railway. Mr. Ballard declared that the fare of 7 cents cash or four tickets for a quarter had enabled the company to operate the Frankford "L," build two crosstown lines, operate the trackless trolley over Oregon Avenue and buy 520 large passenger cars.

"This state," Mr. Ballard added, "still is willing to reward those servants that provide good service." He referred to a section of the public service company law according "to any public service company financial recognition of efficiencies, economies and improvements effected by it."

EFFICIENT SERVICE CONCEDED BY CITY

These factors of efficient service had been conceded by the city and properly considered by the Public Service Commission, Mr. Ballard pointed out, but the commission went further. That body, in determining that the present fair value of the company's property was substantially upward of \$200,000,000, gave due regard, he said, to the many other factors of rate fixing.

The attorney explained that figures submitted to the commission showed that the company's service was "quicker, more frequent and more direct" than in a majority of the leading American cities and that the fare in Philadelphia was 6.6 cents compared with 7.9 cents in those cities.

In June, 1920, the Philadelphia Rapid Transit Company, feeling the need of more revenue because of war prices of labor and supplies, sought to abolish free transfers and exchanges in the delivery district, but the commission ordered a valuation to serve as a basis for a permanent rate of fare. In October, 1920, the company again asked for an increase, this time to a straight 5-cent fare, without transfers or exchanges. The commission refused this and instead ordered a temporary fare of 7 cents cash, with four tickets for 25 cents for six months until the valuation was completed. In May, 1921, this was continued. The valuation hearings did not end until May 15, 1923. The case was argued before the commission on June 11, 1923, and within ten days the commission published its order. The city promptly appealed.

In its original order the commission held in brief as follows:

1. A definite valuation is not essential except to protect the company from confiscation or to protect the public from unreasonable profits.

2. The city's various investment and cost figures are not reliable enough to be controlling and, in any event, the decisions forbid the commission so regarding them.

3. On the contrary, the decisions require the commission to give substantial weight to present reproduction costs. On this basis, the value of the property is substantially upward of \$200,000,000. The city admits \$187,000,000 undepreciated and the commission decides enough disputed items to bring that over \$200,000,000. The commission is not certain anything should be deducted for depreciation, but if so, it is at least offset by going concern value, both of which are intangibles.

4. The present rate of fare is reasonable when compared to that in other cities and to the present value of pre-war dollars; under it the company is giving good service and improving it, and enjoying a generous return after paying liberal operating expenses, so it is not confiscatory. But with a property valuation of at least \$200,000,000, this return is not excessive, so we dismiss the complaint.

Loans Needed for Seattle Municipal Payments

With a cash deficit of about \$780,000, not to be confused with the book deficit of \$1,144,803, the Seattle Municipal Railway will need more loans to meet the \$833,000 redemption payment and \$333,350 interest due March 1 on the \$15,000,000 purchase bonds, according to an announcement of city officials. The financing contemplated between now and Feb. 1, when the redemption and interest money must be set aside, will involve loans of between \$350,000 and \$400,000, treasury officials state.

About one-half of the cash deficit was piled up during the three and one-half months last spring when the railway was on a 5-cent fare between March 1 and June 16. With the return to the 8-cent fare, the railway is making a small net profit, its monthly reports have shown, and the book deficit for the ten months of 1923 for which financial statements have been completed totals \$167,312, showing a considerable recouping of the 5-cent fare losses. City officials are hopeful that the cash deficit will be wiped out by the end of 1924 or early in 1925. Details of the necessary new loans have not been worked out.

Abandonment Authorized

Ohio Body Rules Service May Stop from Youngstown to Girard, Niles and Warren—Cities Seek Postponement

The West End Traction Company, a subsidiary of the Pennsylvania-Ohio Electric Company, controlled in turn by the Republic Railway & Light Company, with the consent of the Ohio Utilities Commission, will terminate its service from Youngstown to Girard, Niles and Warren on Jan. 1. Service will also be discontinued from Niles to Mineral Ridge, from Warren to Leavittsburg and on the city lines in Warren. The population in these com-

to authorize the abandonment of public utility facilities.

The company contended that for the past four years the operation of its system has been carried on at an actual out-of-pocket loss. Moreover, during this period, the officials of the company pointed out, maintenance has been deferred to almost the danger line. On its part, the commission said that the evidence was to the effect that during this period of time the company operating this division had adopted every feasible and practical method of encompassing economies.

The evidence as to the revenues is summarized in the following table:

	Year 1920	Year 1921	Year 1922	Nine Months 1923
Total revenues.....	\$575,919	\$478,129	\$477,729	\$356,634
Operating expenses.....	621,763	544,731	485,324	374,372
Operating deficit.....	\$ 45,844	\$ 66,602	\$ 7,595	\$ 17,737
General taxes.....	63,000	63,000	63,854	29,658
Total deficit.....	\$108,844	\$129,602	\$71,449	\$47,396

munities aggregates 50,000. In all, about 20 miles of trackage is involved. The order of the commission was entered Dec. 14.

The cities of Warren, Niles and Girard, in Trumbull County, have since petitioned the commission to delay until Feb. 1 from Jan. 1 the abandonment of service. The company has consented to the modification of the commissions order with the understanding that increases in fare will be granted to permit operation to continue.

The West End Traction Company filed its application with the commission on Oct. 6. It sought authority permanently to abandon all of its property, comprising an electric railway extending from the westerly limits of the city of Youngstown, to the city of Girard, a distance of approximately 1 mile; thence to the city of Niles, a distance of 5 miles; thence to the city of Warren, a distance of 5 miles, and thence to the village of Leavittsburg, a distance of 4 miles, together with a line running from Niles to Mineral Ridge, a distance of about 3 miles. In addition to these direct lines the company also operates two short loops in the city of Warren.

At the hearing on the matter on Nov. 16 demurrers were filed by the cities of Niles, Warren and Girard and by the Commissioners of Trumbull County, denying the jurisdiction of the commission to hear and determine the application. In arguing these demurrers, counsel cited the franchise contracts between the applicant company and these political subdivisions which reserve the subject of fare revision for adjustment by the parties. It was further alleged that these contracts stripped the commission of jurisdiction in any differences which might arise between the parties.

The commission held that the demurrers were not well taken. The opinion of the commission was that the statutes confer upon it exclusively, jurisdiction

In its finding the commission pointed out that these figures show there is nothing set aside for the deferred maintenance or depreciation accounts and no balance available for a return on the property.

The commission also pointed out that the line traverses a territory which has had a steady and continuous growth in the last ten years, but that the revenue and traffic of the company during this period, especially in the last four years, has steadily decreased. It ascribes the condition confronting the company as doubtless due to the general use of the privately-owned automobiles.

Counsel for the municipalities developed the fact that the revenues as reported did not include the receipts from a coach line which parallels the railway. This property, the commission found, was held in the name of a separate company. As respects this bus operation, the witnesses asserted that it was experimental and that no definite conclusions were yet possible. The commission pointed out that the service operated along this route is not comparable to the applicant's service, and that rates are collected practically double these charged by the traction company.

The main contention of the municipalities, aside from that of lack of jurisdiction on the part of the commission, was that the applicant company should negotiate such adjustments in its fares as would enable the retention of the service. The opinion of the commission on this point was that the following question and answer from the record sum up this situation:

Q. Is it possible, Mr. MacCalla (the vice-president and general manager of the applicant company), under any rate of fare that would be practicable, for that company to make a fair return or a substantial return upon the amount invested in the tracks and property?

A. I believe such a rate as would theoretically do that would have the effect of decreasing the traffic and actually defeating the object aimed at. In other words, I do not believe it is possible to put a rate in

there which would give a reasonable return on the capital after taking care of operating expenses and necessary reserves for replacements.

There was some question in the record as to the good faith of the owners of this property in segregating it. On this point the commission said that the city of Youngstown some time since contracted with the operators of the properties for the segregation of the so-called Youngstown Municipal Railway and that the normal procedure for the owners was to segregate the property involved in the present proceeding under a distinct ownership. In concluding its opinion in the case the commission said:

Having regard for the fact that a common carrier of persons should be financially responsible for the transportation of the people who entrust themselves to it, we must conclude that the welfare of the public will best be served by the abandonment of this line, which is consuming its own capital to maintain its service.

Only 8 per Cent Dividend in New Orleans Authorized

R. S. Hecht, president of the Public Service, Inc., New Orleans, La., has taken occasion to reply to statements made from other than company sources as to the probable course the company will take in the matter of declaring dividends upon its present common stock and the probable issuance of the additional stock, etc.

Mr. Hecht says that at no time has his company considered paying a dividend of more than 8 per cent on the present common stock. Further, the agreement between the company and the city does not authorize a dividend of more than 8 per cent. In fact, money in excess of the amount needed for dividends must be put back into the company. Mr. Hecht said that this process must continue for a period of five years.

With respect to the company's needing more money, Mr. Hecht said it would probably have to have new money each year for several years.

At the meeting of the board of directors in January the budget and program for 1924 will be decided. At the same time the method will be determined by which additional financing can be carried out.

He said the company was spending the new money as advantageously as possible, and that all of the expenditures were calculated to increase efficiency and reduce the cost of operations, which of course would work toward a reduction in fares.

Commissioner Maloney says that the matter of refinancing the New Orleans Public Service, Inc., is not now before the Commission Council. He indicated that the question now up for settlement between the company and the city is the one of the additions that should properly be permitted to be made by the company to the rate base as agreed upon by the company and the city as the point from which the start was made when the present operating arrangement was put into effect.

Abandonment of Alameda Line Approved

Holding that the service on the Fourteenth Street-Alameda Pier suburban line of the Southern Pacific Company is a duplication of the service furnished via the Seventh Street line and the Eighteenth Street line to the Oakland Pier, the California Railroad Commission on Dec. 8 authorized Southern Pacific Company to cease the operation of the Fourteenth Street-Alameda Pier suburban service or the crosstown Oakland-Alameda line on Dec. 27.

The Southern Pacific Company operates across the Harrison Street Bridge a suburban service between Fourteenth Street, Oakland, and the Alameda Pier, also a street car service from the Sixteenth Station, Oakland, into Alameda. It was shown that the company has been operating both these lines at a loss for several years.

The commission found that the public is also served by the Twelfth Street line of the San Francisco-Oakland Terminal Railways, and the Southern Pacific Company crosstown service from Oakland to Alameda is also duplicated by service through this territory by the San Francisco-Oakland Terminal Railways.

The commission found that there is at present an economic waste in the maintenance of these lines by the Southern Pacific Company and that further capital expenditures for a new bridge to permit continued operation over the Estuary cannot be justified. In addition to authorizing the suspension of this service the commission directed the Southern Pacific Company to secure from the cities of Oakland and Alameda the necessary authority, if any be required, to relinquish franchises under which these lines are now being operated.

Consolidation of Philadelphia Companies Urged

Joseph Gilfillan, a director of the Union Traction Company, Philadelphia, who represents a large stockholding interest of the company, has sent a letter to the president and directors of the Union Traction Company, Philadelphia Rapid Transit and the Philadelphia Traction Company, looking to a consolidation of the transit companies of Philadelphia. He points out that any plan looking to the simplification of the present corporate structure should be in the direction of a consolidated ownership of all lines in one corporation.

In the exchange of securities involved, he says, the stock of underlying companies, which own the tracks and franchises would be represented by a first mortgage bond issue secured upon these properties, while the shares which represent the money heretofore successfully spent in the improvement of these properties would be represented by first and second preferred stock, leaving to present operating company, the Phila-

delphia Rapid Transit Company, the common stock interest and the control and management of the system. It is pointed out that the lines in consolidated ownership would amply secure a sufficient bond issue to finance the consolidation.

More Funds for Railway

New Jersey Road Would Sell Terminal and So Secure Money for Railway Business

Sale of the Public Service Terminal in Park Place, Newark, by the Public Service Railway to the Public Service Corporation is proposed in an application for approval filed with the Public Utility Commission. The application indicates a plan to enlarge the terminal, which the railway is not in a position to do because of lack of available funds. In fact, construction of a seven-story addition to the building has already begun.

The purchase price stipulated in resolutions adopted by the directors of the railway is \$2,500,000 subject to a mortgage of \$5,000,000 executed by the Public Service Newark Terminal Railway, formed to build the terminal, and subsequently merged with the Public Service Railway.

Upon confirmation of the proposed sale the agreement between the associated corporations contemplates a renewal of the fifty-year lease, under which the Public Service Railway rented certain space, including the concourse, offices and space occupied by the railway tracks, at an annual rental of \$330,240.

The application sets forth that occupants of the terminal, which include the Public Service Gas Company and the Public Service Electric Company, desire additional office space and that the railway deems it inadvisable, if it had the available funds, which it has not, to make the necessary capital investment for the enlargement. The application sets forth further that:

Such sale will put the property in the possession of an owner which can advantageously make such enlargement, and will in addition thereto put your petitioners (Public Service Railway) in possession of considerable funds to assist it in and about its railway business.

Upon the merger of the Public Service Newark Terminal Company and the Public Service Railway in 1915 the lease between the two companies was canceled, the railway becoming the owner instead of the lessee of the terminal property. The present proposition contemplates the revival of this lease for the remainder of the fifty-year period for which it was originally drawn, the Public Service Corporation instead of the terminal company becoming the owner and lessor.

The annual rental under the terms of the revived lease will remain at \$330,240 until 1965, at which time it may be renewed at the option of the railway on terms to be agreed upon. In the event of a disagreement the rental terms would be settled by arbiters, one chosen by the Public Service

Corporation, one by the Public Service Railway and the third by the two already chosen.

Auction Sales in New York

At the public auction rooms of A. H. Muller & Sons, New York, the following securities were sold on Dec. 19:

392 shares New York Railways Company, \$1 lot.
250 shares Buffalo & Lake Erie Traction, common, \$8 lot; 250 shares of preferred, \$80 lot, and \$50,000 first mortgage 5 per cent bonds, 10½ per cent.
\$2,000 New York Railways 4 per cent first mortgage bonds, due 1942, \$300 lot.
457 shares Aurora, Elgin & Chicago Railroad common, \$100 each, \$3 lot.
333 shares Western Ohio Railroad certificates of deposit, \$100 each, \$6 lot.
\$1,000 Nashville Railway & Light Company cons. 5 per cent bonds, due 1953, 8½ per cent.
100 shares Interborough Consolidated Corporation preferred, \$100 each, \$8 lot.
80 shares Brooklyn Rapid Transit Company (old stock), \$1 lot.
\$2,100 Olean, Bradford & Salamanca Railway first and refunding 7 per cent bonds, due 1951, \$50 lot; 105 shares preferred, \$7 lot, and 252 shares common, \$2 lot.

Trustee Appointed.—George M. Byrne of Winchester, Mass., has been appointed by Governor Cox to the position of trustee of the Eastern Massachusetts Street Railway, to succeed the late Samuel W. McCall, who lived in the same city. Mr. Byrne is a member of the firm of George M. Byrne & Company, builders and contractors, and has been chairman of the Winchester Board of Selectmen for a number of years.

Line Sold.—The Southwestern Traction Company, which operates between Belton and Temple, Tex., has been sold at trustee sale for \$15,000 and the assumption of the taxes and paving obligations that are outstanding against the company. It was bid in by J. C. Houser, present manager of the company, for himself and H. H. Hamilton of New York City. They will try to operate the line and make needed improvements to its track and equipment. The line was built in 1903.

\$712,000 Equipment Trust Authorized.—The San Diego Electric Railway, San Diego, Cal., has been authorized by the California Railroad Commission to execute and enter into an equipment trust agreement and second mortgage, guaranteeing payment of \$712,000 of 6 per cent equipment trust certificates recently authorized by the Railroad Commission to cover the cost of a large amount of electric railway equipment.

To Pay Interest.—Samuel D. Tuell, receiver of the Houghton Traction Company, Houghton, Mich., notified the Old Colony Trust Company, trustee, Boston, that pursuant to the order from the United States District Court for the Northern Division of the Western District of Michigan, under date of Nov. 26 last, he would pay the coupon interest on Dec. 15 which became due Jan. 1, 1923, on the first mortgage 5 per cent gold bonds dated Oct. 1, 1908. Payment will be made with interest on overdue interest from Jan. 1, 1923, up to Dec. 15, at the rate of 5 per cent per annum.

Traffic and Transportation

Higher Fare in Cincinnati on Jan. 1

Formal announcement of an increase of $\frac{1}{2}$ cent in fares was made by the Cincinnati Traction Company on Dec. 15. The new fare, $8\frac{1}{2}$ cents, will become effective Jan. 1. Preliminary reports of the receipts and expenditures of the company for October and November made to William Jerome Kuertz, Director of Street Railways, left no room for doubt that the fare would be increased. Walter Draper, vice-president of the traction company, said that the increase was necessary to meet the company's obligation to pay the city franchise tax. During the past three years the franchise tax has not been considered as a factor in rate making, since under the terms of the franchise the tax is not to be paid unless earned. By consent of the traction company and City Council the obligation to the city was suspended provided that rates would not be increased. That action was taken upon the ground that it would be unfair to the car riders to have the tax continued as a factor where it could not be paid since it had not been earned by the company. Last September, however, the company gave notice of an increase from $7\frac{1}{2}$ to 8 cents effective on Oct. 1, and immediately the provision of the franchise relating to the city tax again became operative.

Favor Change in Night Service in Boston

The Boston Elevated Railway has tried a new method to ascertain the will of the people regarding the operation of its cars in night service, in which the company made a change some time ago. All-night service into Tremont Street subway in Boston was started Oct. 14. Later workers presented petitions claiming that only those who worked in the neighborhood of Scollay Square, Park Street and Boylston Street stations were at all benefited by the new order. All the others who were used to getting the cars at their doors were forced to walk. It was their contention that conditions would be improved if the old service were restored, because most of the employees, tired after a night's work, might go from their work to the street and get the car without the necessity of a long walk.

The trustees refused the petition, but Chairman Jackson at the time said that the decision was not final and that the experiment would be given a fair trial. The latest move on the part of the company has been to submit the question to a vote by the users of the night cars, and it says it will abide by the results. Ballots were handed out to all the riders one day with instruc-

tions for marking crosses against the plan preferred. Of 3,663 votes cast, 1,747 were for the plan to which a change had been made and 1,535 were for the old plan. In this test 247 of the riders stated affirmatively that they had no choice and 134 returned the ballots without marking them in any way.

Fare Injunction Denied to City of Ottumwa

The injunction suit brought by the city of Ottumwa against the Ottumwa Railway & Light Company has dragged its way to a conclusion in the courts. The injunction has been denied by the Supreme Court of the State. The 7-cent fare is held to be legal and just, and all that remains is for the costs to be assessed.

In commenting on the case the Ottumwa Courier said:

It is not difficult to recall that the suit against the company was inherited by the present city administration from the last Leeny régime, and it is not difficult to recall the circumstances under which the fight originated. An effort was made to compel the company to provide service at a rate which involved a loss. If the courts had ordered compliance there could have been but one of two results. Either the company would have been forced into a receiver's hands eventually, or the rates for electric service and steam heating would have been increased to a point at which the resulting revenues would have wiped out the deficit from railway operation.

If a community must have street cars—and every going community needs them—it must provide a revenue sufficient to justify investors in financing a railway or it must tax itself to pay for the upkeep of its own system.

Fare Validity in Milwaukee Questioned

Basing his plea on the recent decision of the United States Supreme Court in the case of the Superior Water, Light & Power Company, of Superior, Wis., a Socialist Alderman of Milwaukee has presented to the Common Council for its approval a resolution requesting that the city attorney take steps to determine whether or not the Milwaukee Electric Railway & Light Company is at present illegally charging a cash fare of 7 cents instead of 5 cents in contradiction to a franchise ordinance passed by the Common Council in 1900 which was to endure until Dec. 31, 1934.

Interpreting the Superior decision as it applies to the Milwaukee situation, it is obvious that the fare set forth in the 1900 franchise is binding and that the Wisconsin Railroad Commission had no power or authority to alter the rates. The Wisconsin Supreme Court, however, has repeatedly decided that control of rates passed to the Railroad Commission, when state utilities were placed under its jurisdiction.

In the case of the Superior Water, Light & Power Company the United

States Supreme Court decided against the State Supreme Court and the city in the methods adopted to acquire by condemnation proceedings the electric, gas and water plants of the Superior Water, Light & Power Company by terms other than those specified in the franchise, which were in accordance with the Wisconsin Public Utilities act of 1907. In upholding the company the court asserted that the franchise and its amendments constituted a valid contract, not subject to abrogation by the state public utilities act.

Adopts Weekly Pass.—The Geneva, Seneca Falls & Auburn Railroad, Geneva, N. Y., has started the sale of weekly pass tickets at \$1 each. Tickets are good for unlimited trips for seven days, commencing Monday of each week, on all Geneva city line cars and on interurban cars in Geneva and east to and including Lake Road stop.

Change Made in Ticket Use.—Regulations governing the sale and use of the forty-six-ride school commutation ticket books for use on the lines of the Albany Southern Railroad, Rensselaer, N. Y., have been changed to provide that on and after July 1, 1924, the time limit on such tickets will be fifty days from date of sale, instead of within the school year in which purchased as at present. The use of school tickets will be confined to pupils and teachers traveling to attend schools where sessions are held at least five days each week.

Fare Hearing Adjourned.—Hearing on the application of the Detroit United Railway to the Michigan Public Utilities Commission for permission to increase its rate of fare from 2 cents to $2\frac{1}{2}$ cents a mile was recently adjourned. It was brought out in the testimony at the hearing on Dec. 17 that the Detroit United Railway had lost more than \$1,000,000 in the last nine months, part of which was due to a \$500,000 annual increase in wages of employees. It is contended that the line had also suffered considerably from bus competition. The company claims that in order to earn a 7 per cent return upon the utility commission's valuation of \$26,691,320, the rate of fare would have to be raised to $2\frac{1}{2}$ cents a mile. Company officials agreed, however, to issue commutation tickets at reduced rates.

Service Restored.—After a trial period of a month and a half in which less frequent schedules were in effect, the Clinton, Davenport & Muscatine Railway will shortly restore the hour and one-half service on its interurban line to Muscatine, Iowa.

Illness Delays Decision.—Serious illness of Mrs. Henry A. Dubbs, wife of Henry A. Dubbs, Master in Chancery, who heard the pleas of the city of Denver attorneys and that of the Denver Tramway relative to the 6-cent fare, prevents the Judge from taking an active part just now and the decision that was expected some time during December will most likely not be given until after the New Year.

Personal Items

D. C. Green Named Manager of Utah Traction

D. C. Green, formerly vice-president and general manager of the Fort Smith Light & Traction Company of Arkansas, has been named vice-president and general manager of the Utah Power & Light Company and vice-president of the Utah Light & Traction Company, Salt Lake City. He succeeds S. R. Inch, who has accepted an important position with the Electric Bond & Share Company in New York. Mr. Green has had a wide experience in the management of electric and gas utilities. Early in 1915 Mr. Green came from the northwest to Salt Lake City as manager of the Salt Lake division of the Utah Power & Light Company. He left Salt Lake City in the fall of 1916, and since that time has been associated with various utilities in a managerial capacity.

The change will not sever Mr. Inch's connection with the Utah companies, since he remains a vice-president and director of both. Mr. Inch first came to the Utah Power & Light Company as general superintendent early in 1913. In January, 1918, he succeeded C. E. Groesbeck as vice-president and general manager of the Utah Power & Light Company and vice-president of the Utah Light & Traction Company.

Joseph T. Hissem, who has been secretary of the Galna (Ill.) Chamber of Commerce and secretary of the Galena Red Star Merchants' Association, has taken a position as auditor in the general offices of the Northern States Power Company, at Minneapolis.

B. E. Bramble, Champaign, Ill., for many years auditor of the Illinois Traction System, has been appointed comptroller of the North American Light & Power Company, according to an announcement made by William A. Baehr, president of the company. Mr. Bramble will divide his time between the Chicago and Champaign offices of the company.

Arthur P. Russell, vice-president of the New York, New Haven & Hartford Railroad, with headquarters at Boston and New Haven, has in addition to his present duties assumed jurisdiction of public relations and publicity. He will now have charge of matters tending to promote harmonious relations between the company and the public and will supervise the preparation of general information to be issued by the management.

Thomas F. Kennedy has recently been appointed new-business manager of all of the Cities Service properties, with headquarters in New York City. His connection with the Doherty interests started in 1901, when he joined the Denver Gas & Electric Light Company as a meter reader. Since then he

has been steadily advancing until in 1920 he was selected as manager of the new-business department of the Western Light & Power Company, with headquarters in Boulder, Col. In July, 1922, he came to New York as assistant to George Williams, whom he now succeeds as head of the new-business work of the Doherty organization.

Mr. Arnold Joins North Shore

Eastern Wisconsin Electric Official Will Have Charge of Buses Used by Interurban

Bert Arnold, Oshkosh, has been called to the post of manager of the motor coach department of the Chicago, North Shore & Milwaukee Railroad, effective Jan. 1. He will have his headquar-

B. W. Arnold

ters at Milwaukee and will report to C. E. Thompson, assistant to the president. Mr. Arnold will have charge of the operation of the motor coach lines of the company and of the expansion of this service.

To the railway men in the Wisconsin territory Bert Arnold is familiarly known as the Wizard of Oshkosh. He is at present manager of railways of the Eastern Wisconsin Electric Company, with jurisdiction over the local properties in Oshkosh, Fond du Lac and Sheboygan and the interurban line between Neenah and Oshkosh. It may sound like overdoing the thing to say that Mr. Arnold knows everybody and everything in the territory in which his company operates, but the statement is substantially true. It is just about six years ago that Mr. Arnold went to Oshkosh. At that time public relations were anything but good and the physical property of the company was somewhat below par. All this Mr. Arnold has corrected. As for co-operation, even the independent bus men use the railway station as a ter-

minal at his suggestion. He demanded a square deal at the hands of the local papers and he has got it. It was Bert Arnold who in 1922 put across in magnificent shape the first separate convention of traction men in Wisconsin.

Mr. Arnold brought to the position at Oshkosh a background of wide experience in railway work. He entered the field in 1899 with the Wheeling & Lake Erie Railway. Next he was dispatcher of the Lake Shore Electric Railway, Cleveland, Ohio, and chief dispatcher of the Muncie, Hartford & Fort Wayne Railway, Muncie, Ind. In 1907 he became superintendent of the southern division of the Illinois Traction System. From his headquarters with that company at Springfield he was transferred to Decatur as superintendent of all lines entering that city, and later was made chief clerk to the general superintendent of the system. In 1910 he was made superintendent of transportation of the Chicago, Ottawa & Peoria Railway. In 1917 he joined the Eastern Wisconsin Electric Company. The career and the work of Mr. Arnold were reviewed at length in the *ELECTRIC RAILWAY JOURNAL*, issue of Sept. 9, 1922.

Obituary

Charles Frankel, president of the Frankel Solderless Connector Company, New York, died suddenly on Dec. 18. Mr. Frankel was sixty-one years of age. He was an outstanding figure in electrical manufacturing activities and was prominent in civic affairs.

F. B. Myers, former president of the Cleveland, Southwestern & Columbus Railway, Cleveland, died in Ashland, Ohio, on Dec. 3. He was a director of the Nickel Plate Railroad and of the Union Trust Company, Cleveland, and had other interests. Early in 1921 he resigned as president of the Cleveland, Southwestern & Columbus Railway, so as to give his entire attention to the Ashland Pump & Hay Tool Works and the Faultless Rubber Company. Mr. Myers was seventy-four years old.

Ralph E. Gilman, special engineer in charge of turbo-generator engineering of the Westinghouse Electric & Manufacturing Company, died in Los Angeles on Dec. 5. Mr. Gilman was graduated from the Leland Stanford, Jr., University, Palo Alto, Cal., receiving his E.E. degree in 1898. He entered the employ of the Westinghouse company immediately after his graduation and completed the apprentice course of the company in January, 1901. The next two years he was located in the engineering department. In 1903 he was transferred to the British Westinghouse Company and spent the next five years in London, England. In 1908 Mr. Gilman was recalled to East Pittsburgh and assigned to special duties in the power engineering department. He was in this department continuously until the time of his death.

for Discussion of Manufacturing and Sales Matters

Philippine Mahogany Trim Lighter than Birch and as Cheap as Cherry—Location of Market Affects Price

A departure from usual car building practice is embodied in the plan of the Chicago Surface Lines to use Philippine mahogany instead of birch or cherry for its interior car trim on account of its lightness and fine appearance. Although this wood is exported under the trade name of "Philippine mahogany," its proper designation is "red lauan." Quarter sawn, it has a beautiful ribbon grain, which, with its dark reddish-brown color, makes it useful for interior finish, furniture, etc. Whether or not it is superior to cherry in appearance is largely a matter of taste. Birch in its natural state is not particularly beautiful, but it possesses properties which make it possible to stain it to resemble almost any hard wood.

In weight, red lauan possesses advantage over birch and a slight advantage over cherry. The weights of the various woods at about 8 per cent moisture content, which is approximating the condition under which the material is used in interior car trim, are: birch, 42 lb. per cu.ft.; black cherry, 34 lb. per cu.ft.; Philippine mahogany, 33 lb. per cu.ft.

QUANTITIES OF TIMBER AVAILABLE

Because they are grown over such wide areas, it is difficult to estimate the exact amounts of these three woods which are available for commercial purposes. According to official estimates, however, there is in the United States about 19,000,000,000 ft. b.m. of birch of all kinds and 500,000,000 ft. b.m. of cherry. A commercial handbook prepared in connection with the Commercial and Industrial Fair held in Manila last February makes the statement that there are in the Philippines 192,000,000 ft. b.m. of the woods of the *dipterocarp* family, which includes Philippine mahogany.

Birch is the cheapest of the three woods. Recent prices prevailing in New York City for red birch varied from \$90 to \$145 per 1,000 ft. b.m. and for white birch from \$85 to \$130 per 1,000 ft. b.m. The price of cherry varies from \$90 to \$180, depending on the quality. Philippine mahogany costs from \$150 to \$170 per 1,000 ft. b.m., depending on its freedom from pin worm holes, its color, etc. In the matter of price, therefore, the advantage is plainly with birch.

An item which should receive consideration in connection with the price of Philippine mahogany is the fact that this wood is likely to have many small

pin holes. This is not considered technically to constitute a defect in the wood, and there is, therefore, no way for the purchaser to guard against this fault. Even the best grades of this wood have pin worm holes, and it is necessary to fill them and then rub off the surface with a cloth. The operation is quickly performed and does not greatly affect the cost, but the necessity for it should receive due consideration when Philippine mahogany is compared with birch and cherry, which do not require filling and polishing.

If an inland market is considered instead of that of New York City, the price differential in favor of birch increases, because that wood is available on short haul from the Lake states. In that region cherry is on an even basis with mahogany, because of the freight rates for the latter from the seaport to the interior. For example, birch was quoted on the Chicago market as late as Dec. 7 at prices from \$60 for the poorer grades to \$130 for the higher grades. This is approximately a third less than the New York price quoted in the earlier paragraph. In fact, for all cities other than seaports, Philippine mahogany would be at a disadvantage because it would necessarily bear the expense of railroad freight haul, as well as ocean freight. Birch is grown in the Appalachian Mountain region and for that section of the country has therefore comparatively short freight hauls. A large proportion of the cherry produced in this country comes from the same territory and would enjoy the same advantage.

Lumber Production at High Level All Year

Lumber production in the United States based on figures collected by the Department of Commerce has averaged more than 230,000,000 ft. b.m. per week since April 1. The largest production in a single week was for the seven days ending Nov. 10, when the maximum of 241,000,000 ft. b.m. was attained. Since that time there has been a slight falling off with the week ending Dec. 1, showing a production of only 225,000,000 ft. b.m. The week ending Dec. 8, however, showed an improvement with a production of 232,000,000 ft. b.m.

The rate of production for the year 1923 is well above that of the last few years. In 1922 the average weekly production was below 200,000,000 ft. and in 1921 it was below 150,000,000. The years 1919 and 1920 were nearly identical with an average weekly production of 171,000,000 and 173,000,000 ft. b.m.

Big Business Expected by Westinghouse Company

Present business bookings of the Westinghouse Electric & Manufacturing Company indicate good results for the second half of the fiscal year. For the first six months of the fiscal year through Sept. 30 the earnings were substantially equal to a full year's aggregate preferred and common dividend requirements. It is expected that operations for the first eight months of the year will show a net available for dividends running between \$14,000,000 and \$15,000,000.

The company is experiencing a resumption of business activity approaching spring and early summer levels, which is keeping the plant operations at capacity. Unfilled orders now approximate \$75,000,000. The company is making an effort to reduce unfilled orders, in order to make delivery on contracts and take care more efficiently of business offered. The Philadelphia and East Pittsburgh plants are operating day and night. The outlook continues satisfactory and the sales department states that there is no indication of slackening in forward business. Bookings in November were larger than in October, which in turn exceeded the September total of \$10,600,000. Indications are that the total for the year will probably be as large as last year, when the amount received was \$152,328,564.

Canadian Control Obtained by General Electric

The General Electric Company has secured control of the Canadian General Electric, approximately two-thirds of the total \$10,800,000 outstanding common stock of the Canadian company having been deposited with it.

As was noted in the *ELECTRIC RAILWAY JOURNAL*, issue of Oct. 27, the directors of both the American and Canadian companies approved the offer of the General Electric Company to purchase the common stock of the Canadian General Electric. Under the plan common stockholders of the Canadian company were offered \$62.50 cash and one share of new \$50 par value 7 per cent cumulative preferred stock of the Canadian company for each share of the common.

Metal, Coal and Material Prices

Metals—New York	Dec. 18, 1923
Copper, electrolytic, cents per lb.	13.125
Copper wire base, cents per lb.	15.75
Lead, cents per lb.	7.35
Zinc, cents per lb.	6.52
Tin, Straits, cents per lb.	47.125
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	\$4.425
Somerset mine run, Boston, net tons	2.175
Pittsburgh mine run, Pittsburgh, net tons	2.05
Franklin, Ill., screenings, Chicago, net tons	1.975
Central, Ill., screenings, Chicago, net tons	1.50
Kansas screenings, Kansas City, net tons	2.00
Materials

Weatherproof wire base, N. Y., cents per lb.	17.50
Cement, Chicago net prices, without bags	\$2.10
Lime oil (5-bbl. lots), N. Y., per gal.	\$0.93
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	11.25
Turpentine, (bbl. lots), N. Y., per gal.	\$0.935

Steel Sales Below Normal Capacity

A survey by the Department of Commerce of the present capacity of the structural steel fabricating industry in the United States indicates that the normal capacity is about 250,000 tons per month. In no month of the present year, however, has the actual tonnage booked closely approached the capacity. The tonnage in March was 235,000, or about 94 per cent of the shop capacity. April was slightly lower, and since that time the figure has been running at about 50 per cent.

Booklet Describes Trade Terms

The recognized interpretation of trade terms and abbreviations as in use in the larger commercial countries is contained in a booklet just issued by the International Chamber of Commerce, at Paris. Copies of the publication, which is both in English and French, are being distributed among the American members of the International Chamber. Non-members in the United States may obtain copies through the secretary, American Section, International Chamber, at Washington.

Victoria Exhibit in Prospect

The Victoria Electrical Federation is planning an electrical exhibition to be held in Melbourne, Australia, during September, 1924. The federation hopes to cover the entire electrical industry, showing actual working models of the various types of apparatus, including machine, transport, lighting and other industrial equipment. The fair will last four weeks.

Rolling Stock

Interstate Public Service Company, Indianapolis, Ind., during 1923 ordered twenty new cars at a cost of approximately \$250,000. This new equipment includes three club and dining cars, three sleepers, two motor express cars, three express trailers and ten live stock cars. This equipment will be built by the American Car & Foundry Company. Reference has been made previously in the *ELECTRIC RAILWAY JOURNAL* to a part of this order and elsewhere in this issue some of the equipment is described.

Twin City Rapid Transit Company, Minneapolis, Minn., rebuilt during 1923 seventy-five double-truck two-man cars into front exit cars.

Eastern Wisconsin Electric Company, Oshkosh, Wis., has purchased a snow plow.

Interborough Rapid Transit Company, New York, N. Y., has placed orders for 100 new steel motor cars with the American Car & Foundry Company for use in the subway in accordance with the order of the commission issued last August. The cars will cost \$30,000 each, making a total expenditure of

\$3,000,000. According to the commission's order, these cars must be ready for operation in the fall of 1924. Under the plan the Interborough Rapid Transit Company, the Rapid Transit Subway Construction Company and the New York Trust Company, as trustees, have entered into an agreement providing for the issuance of \$2,250,000 in equipment trust certificates, bearing 6½ per cent interest, and issued in \$1,000 denominations. This is the second order for 100 cars which the Interborough has placed at the suggestion of the commission following the investigation of the service and facilities of the subway in 1922. The 100 trail cars ordered last year have been delivered and are now in daily service.

Track and Line

Madison Railways has been granted an extension of time from Dec. 1, 1923, to Oct. 1, 1924, in which to carry out the work of double-tracking University Avenue from Randall Avenue to Breese Terrace. The company is now confronted with the immense improvement program of first finishing up the work on Breese Terrace next spring followed by the double-tracking of University Avenue, improving its East Johnson Street line and extending its line on Monroe Street from Harrison Street to Crandall Street.

New York State Railways has completed the Court Street extension to the works of the Onondaga Pottery Company. The men employed at the pottery plant formerly were compelled to walk nearly half a mile at either end of the day.

Shreveport Railways contemplates adding 3,000 ft. of new track to its line within the near future, according to H. B. Hearn, president. Arrangements for a right of way have been completed for the Jewelin Extension of the Fair Grounds Highland car and an ordinance has been prepared calling for a special election to be presented to the City Council of Shreveport within the week, authorizing the granting of a franchise. The new terminal will reach the city limits and will extend along the Fair Grounds property, paralleling Greenwood Road, thence to Jewelin Road.

New York, N. Y.—The American Bridge Company, a subsidiary of the United States Steel Corporation, has received a contract for 4,400 tons of steel for subway route 52 in Queens.

Walla Walla Valley Traction Company, Walla Walla, Wash., will build a branch line from Freewater to Umapine, at a cost of \$100,000. The Oregon-Washington Railroad will have running rights over the line and will share in its construction.

Eastern Wisconsin Electric Company, Oshkosh, Wis., will spend \$5,624 in co-operating with officials of Oshkosh in completing one of the most extensive street improvement programs ever un-

dertaken, which will be started in the spring of 1924 on nine of the principal streets of the city, estimated to cost around \$124,000. The company will pay \$2,317 as its share of paving work on Merritt Street from Linde Avenue to Evans Street and \$3,307 on West New York Avenue from Jackson Drive to the west side of Elmwood Avenue.

Pacific Electric Railway, Los Angeles, Cal., has been authorized to extend its Second Street car service in Long Beach to Alamitos Bay and Maples. Work will be started within the next month.

New Advertising Literature

Truscon Steel Company, Youngstown, Ohio, has issued in pamphlet form "Reinforcement in Concrete Roads Worth Its Cost." This is a reprint from *Engineering News-Record* of Nov. 15, by H. Eltinge Breed, consulting highway engineer, New York.

Silent Hoist Company, New York, N. Y., has issued Bulletin No. 22 descriptive and illustrative of the Silent Hoist electric car puller. The bulletin briefly but comprehensively describes its design and construction, as well as its utility.

Johns - Pratt Company, Hartford, Conn., manufacturer of fuses, has issued a Christmastide folder extending the season's greetings.

Foamite-Childs Corporation, Utica, N. Y., fire protection engineers and manufacturers of all types of fire-fighting devices, has published a new sixteen-page illustrated booklet, "The Essentials of Self-Protection Against Fire." The booklet presents the whole subject of first-aid protection against fire in an unbiased manner. A large reference chart supplements the text with a complete tabulation of the characteristics of all types of chemical fire extinguishers. The booklet is attractively printed in the standard size, 5½ x 8½, for convenient filing and permanent reference. Copies may be had on request addressed to the company at Utica.

Reliance Electric & Engineering Company, Cleveland, Ohio, has issued an illustrated bulletin, No. 5018, which gives the complete details of the design and construction of Type AA Reliance induction motors.

Bridgeport Brass Company, Bridgeport, Conn., is proud of its home city. It has issued an attractively printed folder entitled "See and Know Bridgeport—The Park City. The Industrial Capital of Connecticut." Besides containing a map of the city, hints on what to do and where to go are featured for the traveler in the city. Even the motorists will find the pamphlet instructive, as it contains some general rules on traffic and parking. The folder contains many pretty pictures of beautiful homes and points of interest within the boundaries of Bridgeport.

Another Car Designed to Sell Transportation

IN SOME ways the design of the new light-weight interurban cars of the Pennsylvania-Ohio Electric Company, described elsewhere in this issue, goes further than previous designs have done with the idea of making the ride comfortable and pleasant for the passenger. Deep-cushioned seats, linoleum-covered floors and real mahogany woodwork have become fairly familiar during the past year or two, and it is generally accepted as good practice to keep bell cords, register rods, door engines and the like out of sight. But this railway has gone beyond that by concealing the air pipes to the engineer's valve behind a metallic cover painted to harmonize with the interior car trimming, and by eliminating altogether the advertising signs and luggage racks.

While elimination of advertising presumably does raise the dignity of the interior, the need to do so in a coach is debatable. Nowadays the car cards are for the most part tastefully designed, printed on good quality material, and neatly installed. They are usually inoffensive to the eye and they often furnish the passenger food for thought in idle moments.

The concealment of the air pipes, however, will be considered by everybody to be a good move. These are unsightly at best, and frequently oily and dirty.

The special lighting fixtures and the mahogany trim in the upper part of the Pennsylvania-Ohio cars add unmistakably to the distinctiveness of their interiors. While the lines of these cars are not as good as might be secured, the attractiveness sought has been obtained in substantial measure.

Such innovations as are made in this and other recent cars show that the industry is giving some well-deserved attention to the subject of car design from the merchandising as well as the engineering standpoint. The roads that have adopted these new ideas have invariably found that their business profited and their public relations were improved.

Where the Dangers to One-Man Cars Lie

NEW reports of the last three months indicate a revival of the opposition to one-man cars. These attacks are not confined to any one part of the country. There have been rumblings of dissatisfaction in the East, South, Central States and Far West, and it may be that this condition will be reflected in hostile legislation during some of the 1924 sessions. It is to be hoped that these cases of dissatisfaction are purely sporadic. Nevertheless, the one-man car has been such a boon to the industry that it behooves every railway man to consider what may be done to overcome any sentiment of

this kind which may limit the operation of cars of that type on his road.

There are only three possible reasons for opposition to one-man car operation, namely:

1. A belief that the interests of labor require a larger crew on street cars than is actually necessary.
2. Ignorance on the part of the public of the merits of the one-man car.
3. An attempt by companies to make the one-man car do more than it should be called on to do.

The first reason will probably always prevail to some extent, so long as demagogues exist. Nevertheless, it is not a difficult task to prove that the interests of labor lie in just the opposite course. Not only do one-man operators receive a higher wage than operators on two-man cars, but if the service should be confined to two-man cars, many electric railway companies would have to go out of existence. So-called "full crew" laws were for long a needless expense to the steam railroads, but the public generally has come to understand that they cause an economic waste.

Ignorance on the part of the public of the merits of one-man cars, the second reason mentioned above, may be expected in cities where they have not been in service. It can be overcome only by carefully considered explanation and education before the cars are put in operation and during the early stages of their trial.

Perhaps the greatest danger to the one-man car comes from the third cause mentioned, i.e., from the companies themselves. The merits of the one-man car should not blind any one to the fact that it has its limitations, and its greatest real friends are those who are willing to recognize that it has these limitations.

The One-Man Car Has Its Limitations

IF THERE is an attempt to make the one-man car do more business than it comfortably can, either as regards its loading capacity or the ability of the operator to make change, this condition is immediately reflected in longer stops and slower schedule speed, and if this condition continues the result is not only an exasperated public, but lower earnings per car-hour. In some instances this critical point has undoubtedly been passed, usually through overenthusiasm as to what one-man cars can do. And it is perhaps significant that such cases of overenthusiasm are most apt to be found on properties where the one-man car is comparatively a recent innovation. This is only to be expected, because history has frequently shown that recent converts to an idea are apt to be not only the greatest zealots in its behalf but that they often err in going too far in its application.

Fortunately, there are many ways of overcoming

difficulties of passenger congestion on one-man cars, without abandoning the one-man idea.

The simplest way of helping out the operator when his duties are so many as to slow down the speed of the car is to simplify his task of collecting fares. Usually, there are many possible ways of doing this. Sometimes street collectors can be used to advantage at congested points at certain hours. Occasionally the conditions are such that prepayment areas can be introduced. The time of change making on the car can be made less by the use of tokens and passes, and it can be distributed over a long time and so shorten the length of stops by operating the car pay-leave in one direction and pay-enter in the other. Or the problem may be approached with the idea of shortening the time of other parts of the process of fare collection or in some other way to reduce the work of the car operator.

A good gage for determining whether some time-saving is desirable is the figure attained of schedule speed in miles per hour. Where this begins to get below that of other cities of like population and similar street congestion, or shows a retrogression on the same property, something should be done. If the simple methods described herein and others like them fail, the two-man car may be the only recourse.

Great help along the lines being considered may be expected of the one-man two-man car, provided it really is operated by one man when the traffic conditions call for such operation, and by two men when two-man operation really is demanded, which will usually be during the rush hours. From a tabulation of recent car orders, this seems the most popular type for city railways today. It is an ideal design when used with judgment.

Obviously, such a car in one-man two-man service means considerable extra work for the schedule maker in connection with the conductor's runs, because on many lines there will be few if any straight runs for conductors left. But the task of providing satisfactory runs for the majority of the men is not insurmountable.

Economies Possible on Small Properties Too

IN THIS issue is reviewed at some length the report of a consultant on the railway in Charleston, S. C., which serves a population of 70,000. It is of interest because there are many small properties whose earnings are not very good and with which it is often thought nothing much can be done. Yet in Charleston it was found that material savings could be made, in spite of the fact that about 90 per cent of the city service was already being supplied with one-man cars.

The principal savings are expected to be realized from the elimination of duplicate and waste car mileage and from a speeding up of the cars. The greatest ailment from which the small properties are suffering is a slow, indifferent sort of service. Charleston was not as bad in this respect as many, in spite of its Southern clime. But the system was suffering from an excessive number of stops and several other practices that tended to slow up the operation and not only make costs high but discourage riding. Then there were a number of things, small in themselves but totaling big, that the outside point of view found could be done to cut costs. So there are things to be done, even with the small property. And while cutting expenses, some of the major economy measures also improve the service, and more patronage is thereby attracted.

Make Signs Informative for the Casual Reader

MUCH emphasis is being placed these days on the idea of merchandising transportation. An important part of merchandising is so to describe the goods that the public will know what is being offered and will want to buy. For the regular rider, a single letter or number designation on a car is all that is needed and is a very good plan. But the destination sign should be so worded as to give the stranger and casual rider the maximum possible information.

Perhaps this idea was more fully realized by the street railway men of thirty years ago than it is today, for in those days on the attractive car exterior was painted not only the destination but a catalog of the principal points reached en route. For example, the cars of one line in Washington carried a legend such as this: "Mount Pleasant, Capitol and B. & O. Depot via 14th Street and Pennsylvania Avenue."

With the advent of larger and more complex railway systems such plans fell into disuse on account of the desirability of having all the cars of the company interchangeable. Dash signs, roof signs, and finally the illuminated roller signs have all been used to impart the desired information. Of course, with any type of changeable sign the space available to display routes and destinations is far less than when the whole car body could be used for the purpose. This is particularly true with the roller sign, now almost universally used.

The great advantage of the roller sign is that when a car is changed from one route to another or from one destination to another a suitable sign is immediately available. The necessity thus to be able to transfer a car on short notice from one route to another presents somewhat of a problem to the sign painter, as there must be suitable names on the sign roll. If a car may be operated on many routes it is necessary to have a great number of names and the roll, therefore, assumes considerable length.

In an effort to reduce the length of the roller curtain and thus effect a minor economy, some railways have tried to devise destination names that would serve for more than one route. Sometimes this has been carried to the point of absurdity. Names that are almost meaningless are used simply because of their universal applicability. While this was mentioned briefly in an editorial in this paper last week, attention being called to the bad practice of using non-informative signs on cars out of service, the use of such terms is not confined to cars routed toward carhouses, but occurs in many other instances. Some examples are: "City Line," "Belt," "Downtown," "R.R. Station" and "Bridge."

Such designations are not inaccurate, perhaps, but they are often quite indefinite. The regular rider on a particular line may know which railroad station is meant, and some people probably know what "City Line" means. To the casual rider, or to the stranger in town, however, such designations mean very little. The regular rider knows where the car goes however it is marked and the company gets his fare anyway; but if a few fares from strangers can be gathered in by making it easy for them to know the car's destination this money is just extra profit. Hence, why not make the sign tell just as much of route and destination as space and ingenuity permit?

These D. U. R. Containers for Less-than-Carload Service Have 2½ Tons Capacity and Can Be Shipped Sealed from Origin to Destination

Demountable Containers Expedite Freight Handling in Michigan

By E. J. Burdick

Vice-President and Manager Detroit United Railway

A Special Truck Chassis and Demountable Containers Have Been Adopted by the Detroit United Railway to Pick Up and Deliver Less-than-Carload Freight Shipments with Maximum Economy—The Company Now Is in Trucking Business at Request of Wholesalers' Organization

A METHOD of handling freight in less-than-carload lots has been adopted by the Detroit United Railway to facilitate loading and unloading and allow through routing of the shipment without rehandling. Essentially the plan consists of the use of relatively small containers that can be loaded and sealed at the point of origin, and then carried either on any motor truck or more conveniently on a special chassis to a point where the containers are loaded on a special flat car of the railway. At the receiving end the process is reversed.

This arrangement saves nearly all the time formerly used in the trans-shipment at the railroad terminals, and permits a more intensive use of the railway's equipment. A description of both the mechanism and the manner of its employment are of interest.

Careful study of the freight problem by the Detroit United Railway resulted in the formation of a subsidiary company to handle the trucking, both in long distance hauls and in pick-up and delivery service. In planning the basic idea as well as the major part of the developed details, we have contended that the motor car—both for passenger and freight—has its proper place in the field of transportation, and that it is advisable for electric railways to adjust themselves to the new system of motive power through co-ordinating the two, instead of refusing to recognize the utility of this suddenly developed method of conveyance.

The regulatory law recently enacted by the State of Michigan contains a general policy covering road conservation and wild-cat operations. The state policy having been determined, the Detroit United Railway was in a position to know what it had to face both in

the way of possible competition and expansion. Its first definite step was the incorporation of the Detroit United Railway Trucking Company, with a capital stock of \$500,000; all stock held for and in behalf of the interurban system.

After several meetings of the department heads it was thought that, theoretically at least, the use of demountable truck bodies seemed the proper step. Such bodies could be hauled to established car lines, there transferred as units to flat cars and at the other end retransferred to trucks and distributed without disturbing the contents. This plan also allows a minimum use of the highway and a maximum use of established rights-of-way, very largely company owned. Michigan laws place a maximum upon truck load and length of motor trains. It appealed to the Detroit United, therefore, that economies which would result from placing several motor loads on one electric freight car and several cars in the trolley train, thus reserving the trucks themselves for the many terminal trips for pick-up and delivery, would give them a decided advantage over intercity trucking competitors using the highways.

ADVANTAGES OF THE PLAN

There are many advantages to follow such a co-ordinated trolley and truck shipping system as the Detroit United Railway is contemplating. According to the old system the product is packed at the shipping room in the factory, loaded on a truck body, unloaded at the railway freight house and loaded into the freight car. After arriving at the end of the railway trip exactly the same number of moves is made at the point of delivery.

Compare this with the demountable body which can be placed either in the factory shipping or stockroom. The loaded body is moved to the truck chassis and carried directly to the electric railway car or loading platform and is transferred without disturbing the contents. This avoids four labor handlings in shipping, four in receiving, and makes substantial savings in the standing time for truck and driver. Fractional loads contained in packing cases of assorted sizes can be handled readily with this equipment with the same saving in labor at the freight station as is obtained with full container shipments. The fewer the number of handlings, the less will be the loss and breakage. As an additional precaution, the new type containers can be sealed by the shipper.

PERISHABLE PRODUCTS BETTER HANDLED

The handling of perishable products has always presented shipping difficulties. Every hour of delay decreases the value of the shipment. Consequently overnight delivery is a very desirable service. Under the new plan a demountable case can be left at the farm. When it is filled the farmer or the company, as may be agreed, takes it by motor truck to the nearest receiving station, where it is loaded on a car. In the morning, after the shipment has arrived at the rail terminal, it is delivered to its destination intact, with the contents in the best possible condition. It is under seal from the time the farmer does the packing until that seal is broken by the consignee.

Compare this method with the usual plan now followed in handling farmers' products to the market. The goods are subject to long delays, exposure to heat and cold and are passed through many hands. In addition, the crates are turned first on one side and then on the other as they are stacked and packed in warehouses and cars. Sometimes the product of one farm is so mixed with that of others in the selling that to a considerable extent identification is lost.

In addition to its advantages in the transportation of perishable farm products, the container arrangement is applicable to the handling of manufactured machine parts under a plan which may be called a "machine to machine" delivery. Parts may be put directly into containers at the machine as manufactured and delivered to an assembling plant in some other town without expensive packing and excessive handling costs. The construction of the containers makes it simple to move them about the plant by use of the ordinary type of

Containers When Mounted on Flat Car Are Locked in Position

Flat Car Has Channels for Container Wheels. Locking Device on Axle of Container Engages Recessed Bar on Car

industrial tractor. Extra containers may be provided so that they can be put directly into the assembling plant and the parts used as required with no additional handling.

At the present time the Detroit United Railway is engaged in trucking and is awaiting approval by the State Commission to put the new plan into general use. At the earnest solicitation of the Wholesalers' Bureau of the Detroit Board of Commerce, the Utility Commission authorized establishing a trucking line of 80 miles from the end of the Detroit, Jackson & Chicago Railway at Jackson, Mich., to Sturgis, Mich., through Hillside and Coldwater. This route is more extensive than the company had originally planned in connection with a contemplated pick-up and delivery service. The demand for speedier transportation from this territory to and from Detroit was such that the company agreed to try it out, using for the present time the ordinary trucking equipment.

Some idea of the extent of this service may be gained from the following schedule: Freight is received up to 4 p.m. at Detroit for Jackson and is carried over the

Arrangements for Handling the Containers

At the left, the ball-bearing wheels and locking hook and link are shown. At the right, the winding drum for loading may be seen. The large doors are removable to facilitate packing and unpacking.

electric line during the night. At 8 a.m. the following day truck distribution for Sturgis is started, which is usually completed by 3 to 4 p.m. that same day. In the reverse direction a pick-up truck leaves Sturgis at 8 a.m., picks up freight at intervening stops between Sturgis and Jackson, loads the freight into an electric freight car that afternoon and the merchandise arrives in Detroit the following morning. For this pick-up and delivery service a charge of 25 cents per 100 lb. is made over the regular steam road rate. This method has proved highly satisfactory and eliminates trucks using the highway between Jackson and Detroit. The service was started with 1½-ton trucks, which have been replaced with 5-ton chassis, all equipped with the demountable apparatus but using for the present the ordinary type of body.

THE MECHANICS OF THE CONTAINERS

How to put on and take off the bodies from the truck chassis was found one of the great problems to solve. Cranes on every car and cranes at every loading station spelled a big investment which seemed impracticable from the railway standpoint. Attention was called to a

Loading Mechanism and Channel Tracks Are Bolted to Chassis. Channelways on Rear Can Be Adjusted for Height to Meet Similar Channels on Platform. Hooks Hold Front Container to Truck

worm and endless chain device made by the Ideal Truck Equipment Company of Chicago as a possible solution of the problem. An examination of what this company had indicated that the idea was there, but that it would have to be developed further to suit our needs. This was done through the co-operation of the railway engineers with those of the equipment company. The present device utilizes the truck motor to move the container on or off the loading platforms. This device does not prevent the chassis being used with a regular truck body in the ordinary manner.

The loading and unloading mechanism mounted on the truck chassis consists of a superstructure containing a pulley at each end, over which is run a steel cable receiving its power from a winding drum through a chain and worm mechanism driven from the truck transmission. Flared channelways are provided to form a

track for the containers. These may be adjusted vertically to align with similar channels on the loading platform of the freight house. An engaging hook on the cable pulls the container on or off the truck as occasion demands. The mechanism contains a locking device for holding the containers in position during transportation on the truck and a cutout device which automatically stops the operation when the load has been pulled into the proper position. The rear container is stabilized in its position by side bearings. The forward container is held by hooks on the truck which engage its front axle. The containers are held in position on the flat car by similar means. Containers of this type have taken curves at speeds of 60 m.p.h. without slipping from their positions.

The containers, developed with the co-operation of the Fisher Body Company, are built up of light but rugged angle-iron framing with permanent corner panels of plywood which cover approximately one-third of the area on each of the four sides. On the bottom, two substantial sills are formed of 3-in. x 5-in. x ½-in., 8.2-lb. steel angles which carry the cast-steel bearing housings for the support of the wheels, axles and locking device. The wheels, which are flangeless, with a diameter of 9½ in., are mounted on ball bearings and travel in steel channel tracks on the chassis, loading platform and flat cars. The wheel gage is 31 in., and the axles are spaced on 4-ft. 3-in. centers.

A substantial maple floor is laid over the sills. The entire framing structure is reinforced with gusset plates and brackets. Approximately two-thirds of the area on each of the four sides is inclosed by a pair of doors extending full height. These doors are arranged so that they can be entirely removed to facilitate packing and unpacking, leaving an opening 48½ in. wide. A locking bar holds them securely in position so as to make the closed container entirely weatherproof. The weight of the complete equipment, including the auxiliary mechanism on the chassis, is comparable with the weight of an ordinary oak van truck body of equal capacity. The inclosed half-sized unit has over-all dimensions approximately 6 ft. 6 in. wide and 7 ft. 6 in. long. The over-all height from wheel tread to roof is 6 ft. 10 in. and the height from floor to roof of the container is 5 ft. 9½ in. Each of such half-size containers is designed for a capacity of 2½ tons.

For the shipment of goods which do not require protection from the weather an open type of container has been developed. This has simple stake sides, but is mounted on the same floor as the inclosed container described.

Using a 5-ton truck chassis, either one full size or two half size stake or inclosed type containers may be carried.

The accompanying illustrations show the type of construction employed and the arrangement of containers on both truck and flat cars.

Annual Meeting of F.E.S.

THE annual meeting of the American Engineering Council of the Federated American Engineering Societies will be held Jan. 8-11 at the Shoreham Hotel, Washington, D. C. The sessions will include a Public Works Conference on Wednesday, sessions of the American Engineering Council on Thursday and Friday, and a banquet for the A. E. C. and delegates on Thursday evening.

Trainmen and Community Work for Safety*

San Diego Trainmen Share in Safety Savings According to Car-Hours Worked—Citizens Organize to Reduce Street Hazards

THE San Diego Electric Railway has recently made a change in its method of distributing its bonus to the trainmen from the "Safety Fund." This fund has been in force since 1914, when the company announced a plan for stimulating among the platform men a more personal interest in accident prevention and the safe operation of cars. It set aside in that year 3 per cent of the gross revenue, out of which was to be paid all the claims for personal injury, property damage, outside law, courts, including witnesses, medical, hospital and other expenses and announced that the rest would be divided among the car men on a car-hour basis. In other words, the man who put in the greatest amount of platform hours participated to the greatest extent in the savings.

Five platform men were chosen to represent the car men in connection with this fund. They were called the safety committee and held meetings one night each week to review the accident reports of that week. Having the experience of car men themselves, they could readily see the mistakes that their fellow workers made, and it was the duty of this committee to call to the attention of the men connected with an accident where a mistake had been made in judgment and where pure carelessness played a part. For this service the members of the committee were paid \$3 apiece a week, this sum being taken from the fund.

Up to 1923 it is estimated that the car men in San Diego have been able to divide close to \$100,000 through this fund, many of the checks to individuals running considerably over \$100.

The system has worked very satisfactorily for both company and men, and there has never been any thought of abandoning the principle. Experience has shown, however, a few desirable improvements. Thus, it was found that many men who had had accidents were receiving at the end of the calendar year proportionately as much as those who had had no accidents at all. Hence, beginning with Jan. 1, 1923, a plan was adopted to equalize the bonus on the basis of the man-hours worked and also of the number of accidents each car man had had. A slight change was made also in the amount of money assigned to the fund, which was changed to 3 per cent of the gross revenue from the transportation of passengers up to and including \$1,000,000 and 2 per cent on the next \$500,000.

The method of computing immunity from accidents is put on a monthly basis; that is, in each month that a man has no accident for which he is responsible, he is credited with 8.33 per cent (which is one-twelfth of 100 per cent). At the end of the year the percentages thus obtained by each man are totalized, the men are divided by these aggregate percentages into several classes, and the per cent that each class bears to the total is ascertained. These percentages will then represent what per cent will be taken of the total remaining in the fund and divided among the men in each individual class.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

The total number of hours worked by the men for the year in each class is then divided into the total amount of money available for the class to arrive at an hourly rate, and the amount of money for the class is then divided among the men in the class according to this rate and the individual hours worked. To participate in this plan, a full month must be worked with a lay-off allowance for regular men of not more than four days per month and for extra men of not more than six days per month.

All platform men who may be detailed by the transportation department to temporary work, such as selling tickets, work-car service, traffic count, dispatching on account of construction, flagging on account of construction, acting in the capacity of relief receiver or temporary inspector, do not lose the credit of 8.33 per cent because of failing to put in the required number of days on platform work. However, the total number of days worked during the month, which includes the number of days that a man may have put in on the cars and on his temporary work, must equal the number of days he would have been required to put in on the cars had he remained on his regular run and not been detailed to the other work.

The responsibility for all accidents is decided by the safety committee.

SAFETY CO-OPERATION NOT LIMITED TO COMPANY EMPLOYEES

While realizing that the consummation of any safety program is mostly dependent upon its own efforts and that of its own employees, the company realizes that the co-operation of the public is also most necessary. Having started the practice of caution at home, it felt it was justified in asking for the co-operation of the public and was fortunate in securing the co-operation of the heads of various civic bodies in organizing what is known as the San Diego Public Service Committee, whose purpose is to eliminate, so far as possible, all traffic accidents.

Fifty citizens volunteered to act as a vigilance committee in reporting careless or reckless automobile drivers to the executive committee. The committee in turn writes a courteous letter of warning to the driver, and three such warnings constitute sufficient reason for his arrest. This committee meets at luncheon every Monday, and its duties are not alone directed to the automobile hazards but to anything that constitutes a menace upon the streets. The result of this plan, conducted under the direction of a temporary organization, has proved so satisfactory that it has recently been decided by the citizens to make the committee permanent.

Standard Watches Insure Accurate Time*

SOME companies operate under the theory that because street railway schedules are subject to so many interruptions, it is not particularly important for the men to have accurate timepieces. On the El Paso Electric Railway system, however, it is believed that the very fact that it is difficult to maintain good schedules makes it imperative for the operators to have the correct time. During the year all trainmen have been required to secure regulation watches of standard makes, and these watches are inspected twice a month and a record of their condition is kept. This tends also to induce greater effort to keep cars on time.

Traffic Problems in a City of 70,000

**A Recent Traffic Analysis Made of the Charleston (S. C.) Electric Railway System
Disclosed a Number of Possible Improvements and Economies, Even
Though One-Man Cars Were Being Used Almost Exclusively**

THE transportation situation in Charleston, S. C., as described in the survey recently made for the company by John A. Beeler, New York, shows a condition which probably has parallels in a number of other cities of like size. In 1910 Charleston had a population of about 59,000 and in 1920 of 68,000. The street railways in the first part of the last decade were fairly prosperous, showing from 1911 to 1914 an operating ratio of from 67 to 69 per cent, with operating revenue in the neighborhood of \$400,000. During the next four years the operating ratio increased to from 72.3 to 77.9 per cent, while in the last five years it has been over 90 per cent for every year. For every year except 1920 it was over 97 per cent, and in 1921 and 1923, based on the first five months' operation, it was more than 100 per cent. During the war riding greatly increased because of activity at the Charleston Navy Yard, but since 1920 traffic has gone back to about the trend of the pre-war figures. There is no jitney competition.

The report of the Beeler organization suggests a plan by which the company will be able to make a saving of \$148,530, or about 25 per cent of the operating expenses, and still serve the city as well as if not better than with present service, in spite of the fact that operation in Charleston has been largely by one-man cars. Since the completion of the report it has been accepted by both company and city. An abstract of the report follows:

RAILWAY CONDITIONS IN CHARLESTON

The Charleston railway operates a total of 39.44 miles of track, of which about 10.7 miles are on the interurban line connecting North Charleston and the Navy Yard with the city. The balance is on the city lines. The service calls for the operation of thirty-four base cars and ten additional during the rush hours, making a total of forty-four cars in daily service. In 1922 the system transported approximately 10,000,000 revenue passengers and had a gross operating revenue of \$634,000.

The city of Charleston is one of the oldest in the country, having been founded by the British in 1670. The growth has been slow but steady from the first census in 1790, when it had a population of 16,000, to the present time, with its population of 67,957. This population is fairly evenly divided between whites and blacks, there being 35,585 of the former and 32,372 of the latter. The distribution of races throughout the city is likewise quite even, except for a few localities. The total population, including that of the contiguous territory served by the interurban, is approximately 72,000.

The present incorporated area is approximately 3 miles long and 2 miles wide and is bounded by water on three sides. Fully two-thirds of the people live within one mile of the business center of Charleston. This proximity to the business district encourages

walking and tends to a low riding habit. The accompanying maps indicate that there has been a tendency to overtrack the city. There are four lines of tracks running lengthwise and four crosswise.

The revenue rides per capita per annum was about 130 in the period just preceding the war. This figure dropped slightly during the first two years of the war, but after the United States entered the conflict the Navy Yard began increasing its forces and the peak of over 220 rides per capita was reached in 1920. Since then the drop has been precipitous, due to the general industrial depression and the fact that very little work is going on at the Navy Yard. In consequence, the

Typical Graph Showing Passenger Loads During Non-Rush Hours on East Belt Line

rides per capita based on the first five months of 1923 is back to the pre-war figure of 130 per annum. Fluctuations in the total passengers carried by years are shown in one of the charts on page 1086.

In addition to the lessened business activity, the increased use of the automobile has, no doubt, had some effect on the street car riding habit. There are about 4,500 motor vehicles of all classes in the city. However, there is a general increase in the use of the automobile throughout the United States, and in spite of this fact most street railways are showing an increase in passengers carried.

The railway operates six routes, five of which are city lines and one interurban. Comparative financial and operating statistics, by routes, for twelve months' operation based on May, 1923, are given in Table I. As will be seen from the table, every one of the city lines shows a deficit.

The volume of service rendered is remarkably good. Rarely does one find passengers standing even during

TABLE I—PASSENGER REVENUE AND EXPENSES PER CAR-MILE BY LINES, CHARLESTON

Annual and average, based on operations in May, 1923

Line	Car-Miles	Passenger Revenue	*Operating Expenses	Operating Deficit	Average Cents per Car-Mile, 1923—			Car-Miles per Day
					Passenger Revenue	*Operating Expense	Deficit	
Belt.....	470,700	\$117,240	\$121,000	\$3,760	24.91	25.7	\$0.79	1,284
Broad Street.....	261,700	50,500	68,040	17,540	19.30	26.0	6.70	719

* The amounts shown for operating expense include taxes. Operating costs have been determined from the system averages and by making allowances for differences in type of equipment and car speeds on the various lines.

† Surplus.

the rush hours. In fact, it is not a question of furnishing seats but more a question of passengers to fill them. The company has made no effort to curtail the service. In fact, it has steadily increased the number of car-miles operated. The rate of fare is the same as last year, viz., 7 cents cash, or four tokens for 25 cents.

A comparison of operations in Charleston with those of street railways elsewhere is given in Table II. In the first column are the latest available figures from reports of the American Electric Railway Association. The second column gives the Charleston railway operations for the same periods as covered by the association reports.

TABLE II—COMPARISON OF CHARLESTON AND OTHER CITIES

	A. E. R. A. Electric Railways	Charleston Railway
Average rate of fare in cents.....	7.13 (a)	6.02
Annual revenue per capita.....	\$12.70 (b)	\$8.81
Operating revenue per mile of single track.....	\$20,292 (b)	\$16,080
Operating revenue per car-mile in cents.....	45.9 (a)	30.8
Operating expenses per car-mile in cents (d).....	36.2 (a)	33.1
Operating ratio, per cent (d).....	78.97 (a)	107.37
Taxes, per cent of operating revenue.....	7.13 (a)	9.48
Revenue passengers, per cent (c).....	inc. 6.63 (a)	18.05 dec.
Revenue passengers per car-mile.....	6.2 (a)	4.9

(a) Average of eighty-one urban railways for first four months of 1923.

(b) Average of fifteen cities, 60,000 to 80,000 population, for year 1922.

(c) Increase or decrease compared with same period 1922.

(d) Including taxes.

The average fare is 16 per cent lower than the average elsewhere. The density of business, as represented by the operating revenue per mile of track, is 26 per cent lower in Charleston. Even though the fare were the average rate, viz., 7.13 cents, and there were no change in the riding habit, the volume of business would total only \$16,100 per mile of track, or less than 80 per cent of that in the other cities last year. The operating revenue per car-mile in Charleston is less by nearly one-third and the operating expenses per car-mile about 10 per cent less. It is notable that the total receipts per car-mile in Charleston are 15 per cent less than the operating expenses of the average company.

THE SURVEY

To determine what readjustments in service could be made without disturbing the trend of travel, considerable field work was necessary. Traffic counts were taken at all of the principal transfer points, the peak load points and points where there was considerable interchange of traffic—seventeen locations in all. Each point was counted from 6 a.m. until 12 midnight for a two-day period and the results averaged. The counts were taken on weekdays when the weather was fair and other conditions such that normal traffic would be expected. The men stationed at these locations took a record of every car passing, noting the following:

Route, destination, direction, car number, time of day and the number of passengers arriving at and leaving the point. The results of these observations were tabulated and charted. Records were also made for a number of typical trips of all stops, the location and volume of the passenger interchange, the time at time points, delays and any features which might influence the movement of the car. On three lines the origin and destination of each passenger were observed as further aids in determining possible readjustments on these routes. Charts were prepared from these rides, and a typical one showing the origin and destination of each passenger is presented on page 1081.

CARS SHOULD BE REROUTED

In Charleston, as in most cities, the greater part of the demand for transportation is from the residence sections to the business section of the city. A considerable amount of the company's business is the result of the demand for service between the city of Charleston and the Navy Yard and North Charleston, which is cared for by the Suburban line. Since the business district is not confined to any one section, there is also a demand for cross-town service as a means of connecting the various civic centers and providing transportation between the hotels and the Union Station. This class of service encourages the use of street cars by the patron who has only a short way to go. Service which caters to the short-haul rider, the patron who enables the company to earn money, must be made as direct, speedy and generally attractive as possible.

The present and proposed routes are shown on page 1085. It is believed the new routing will serve the city better than the present one. It will provide the average patron with faster and more direct service and it will eliminate much of the waste in the present service, especially duplication and operation in unproductive territory.

The routing of the Suburban and Meeting Street lines will remain unchanged. The King Street line will loop back via Calhoun, Meeting, Broad and King Streets, resulting in one-way operation on the congested portion of King Street between Broad and Calhoun. On this portion of the line there is only one track now, because of the narrowness of King Street. The new routing will eliminate the necessity of cars now waiting at turnouts in this single-track section.

On the Rutledge Avenue line the detour to President Street will be eliminated and in the downtown section the cars will loop back via Meeting, Broad and King Streets. This will remove some of the excess service running to the Battery. A complete rearrangement of the Broad Street and Belt lines is recommended which will eliminate most of the present duplication of routes.

The cost of the additional special trackwork required

to make this rerouting effective should not exceed \$12,500.

The co-operation of the city authorities in the matter of regulation of vehicle traffic will be required for best results in obtaining a prompt movement of cars. The fact that costs due to accidents and damages have increased 145 per cent since 1913 illustrates the need of better traffic regulation.

Parking should be minimized on streets which have a large volume of traffic. Secondary streets having little importance as thoroughfares should be used for this purpose. Among other things, automobiles should be required to stand parallel to the curb with the adjacent wheels within 6 in. of the curb. No parking should be permitted opposite a trolley loading space.

SERVICE READJUSTMENTS

The company is at present using an up-to-date form of schedule modeled after the A.E.R.A. standard. In making new schedules to conform with the routing changes, the use of this form should be continued. The service readjustments were determined after a careful check of the riding habits on the various lines. Barring irregularities, the proposed schedules will furnish as many seats as passengers during every hour of the day, which is certainly liberal. In fact, such an arrangement is impracticable in many cities. An outline of service changes are summarized in Table III.

All of the proposed headways are more than sufficient to meet the traffic demands and are in equal divisions of an hour, so that cars will pass a given point at the same time after each hour. This is of great value to patrons and tends to increase riding.

The new schedule calls for 8.70 car-miles per car-hour instead of 7.91 as at present. Slow operation tends to discourage riding, waste power and increase accidents. It is also the general experience that schedules which are too slow tend to carelessness on the part of the operator. If the motorman is obliged to keep busy he will be more watchful and fewer accidents will be the result. The reduced congestion on King Street will be a large factor in minimizing the delays on that particular line.

At present all of the lines with the exception of the King Street and Suburban lines are operated with one-man cars. It is the intention of the company to put one-man cars in service on King Street as soon as a sufficient number of the cars are equipped with safety devices. This is in line with the most modern practice.

Expressed in terms of the different types of equipment, the total daily car requirements are as follows:

	Two-Man	One-Man	Trailers
Present	18	25	3
Proposed	9	21	3
Saving	9	4	..

This results in a saving of nine two-man cars and four one-man cars. The saving in the one-man cars will be especially appreciated as a shortage of this type was inevitable with the beginning of one-man operation on King Street under the present system of routing.

GENERAL IMPROVEMENTS DESIRABLE

There are a number of factors influencing the quality and cost of service which often can be improved if attention is directed to them. Suggestions particularly applicable in Charleston are enumerated in the following paragraphs:

Some confusion exists at present as to the exact location of passenger stopping places. Stops are made occasionally at a number of short side streets where none is authorized. The far side stop at transfer points was abolished, but this rule is not definitely followed. On the Suburban line, where there are definite stations, they are marked with small enameled signs, but some of these are entirely effaced. To mark definitely the stopping places of cars, the trolley poles at these locations should be painted with a white band about 3 ft. wide at a suitable height bearing the words "Car Stop" in black letters. The use of this type of sign is almost universal throughout the country and has been found very satisfactory wherever tried. It is plainly visible from a distance, and it is cheaper and more permanent than any other device.

The stopping places on the city lines average about fourteen to the mile, while the actual stops made vary from 4.3 per mile on Rutledge to 7.7 per mile on King. The Suburban line, with 8.4 stopping places per mile, averages 3.8 actual stops for the same distance. Most of the stops are made in the delivery area and some are at insignificant alleys or in the middle of the block. These superfluous stopping places should be eliminated, not only for the improvement of the street car service but as an aid to the movement of general traffic on these busy streets. City stopping places should not be closer than eight to the mile in order to secure satisfactory results. To make eight stops per mile requires a stop every forty-five seconds and is all that the most modern equipment and a skilled motorman can do and maintain any schedule worthy of the name.

The present schedules do not provide for a layover or scheduled standing time at line terminals. While the allowed time is sufficient to provide for minor delays, better operation would be obtained if the scheduled time were faster and a short layover provided with the time gained to care for the delays that are bound to occur.

The present practice in Charleston is for a patron to state what transfer he wants when he boards the car. The conductor, however, does not issue the transfer until the patron is leaving. This delays both the

TABLE III—PRESENT AND PROPOSED ROUTES, OPERATING DATA AND WEEKDAY SCHEDULE

Line	Round Trip, Miles		Base Headway (Minutes)		Car-Miles		Car-Hours		Car-Miles per Car-Hour	
	New	Old	New	Old	New	Old	New	Old	New	Old
Belt	4.52	4.74	10	7	1,030	1,284	133	168	7.73	7.64
Broad Street		6.44		10		719		97		7.42
Columbus-Spring	1.95		15		140		18		7.80	
(a) King Street	5.13	5.62	10	12	555	524	72	76	7.70	6.90
Meeting Street	7.64	7.64	30	20	290	426	38	56	7.64	7.61
(b) Rutledge Avenue	7.87	9.56	10	10	930	1,036	118	132	7.87	7.85
(c) Suburban	18.60	18.60	30	20	1,140	1,399	92	152	12.39	9.21
Totals and averages					4,085	5,388	471	681	8.70	7.91

(a) On King Street before 7 a.m. and after 9 p.m. a twelve-minute headway should be maintained.
 (b) In addition to a special trip per morning and evening for colored workers at the fertilizer plant.
 (c) For the present demands, six extras should be operated in the morning and eight extras at night. This includes the two-car and three-car train to the Navy Yard at night. The car-hours and car-miles shown include the extras.

This includes the two-car and three-car train to the Navy

alighting and boarding passengers. It would be much better if the transfers were issued to passengers only when they board the car.

The center-entrance cars are equipped with two doors, but only one of these, the forward one, is used. Keeping this door closed gives a little additional seating space, but it would be better to use both doors as an aid in speeding up and improving the service.

The track switches now in use in Charleston are hand operated, by short switch-irons, which make it necessary for the motorman to leave his post to throw the switch. With one-man cars, this makes serious delay and fare collection becomes more difficult. Electric switches should be used wherever the headways are five minutes or less. Switches not electrically operated should be thrown from the car. Hand switch-irons long enough to permit this operation should be provided.

Observations showed that while there was opportunity for a great deal of coasting, very little was done.

of paving so required has recently been reduced 50 per cent. It should be eliminated entirely.

It has been the policy of the company not to set aside a reserve for renewals and retirements, but to keep the physical plant in condition by charging all current renewals to the maintenance account. Only actual additions to the plant, such as the addition of safety devices to cars, are added to capital account. The generally accepted practice, however, and one which guarantees greater protection of property and minimizes the fluctuations in the operating expense, is to set aside an annual reserve for renewals and retirements and to use it as needed. The company should accrue annually a sum for this purpose.

SAVINGS POSSIBLE BY PLAN

Table IV shows in detail the present operating cost per car-hour of the different types of equipment. An analysis of the savings possible from reducing the car-hours shows that for each hour saved expenses will be reduced as follows: Two-man car, \$1.658; one-man car, \$1.009; trailer, \$1.002.

Maintenance of equipment is not included in this estimate because it is considered later, but three-fourths of the maintenance of way car-hour cost was taken, as the ratio of the car-mile to the car-hour reduction is 3 to 4. No change was estimated for the general expense or taxes, so that the estimated savings should be conservative.

The total annual reduction in expenses that should follow all changes recommended is shown in Table V.

SHOPS AND CARHOUSE

Maintenance of equipment costs increased steadily until 1921, when the peak was reached. At that time the cost per car-mile was 6.1 cents, or 454 per cent higher than in 1913. The present figure of 5 cents per car-mile is 354 per cent greater than before

Plan of Carhouse and Shops, Charleston, with Proposed Additions of Storeroom and Carpenter Shop

One of the standard forms of power saving devices should be adopted. Their efficient use reduces power consumption and gives more comfort to the passengers, as it necessitates more uniform acceleration and braking. Probably 10 per cent of the power cost can be saved after the power saving devices are paid for.

Reports from eighty-one electric railway companies in the United States for the first four months of this year show that approximately 7.1 per cent of the operating revenue is paid out in taxes. For the same period, the Charleston railway paid 9.5 per cent of its operating revenue for this purpose. Some substantial relief should be afforded the railway. In addition to the regular taxes the company paves a portion of the streets between and adjacent to the rails. The amount

the war. This indicates either abnormal renewals or need for greater economy in the shops or both.

The general arrangement of the shops is good except that a storeroom should be provided in the rear of the middle portion of the carhouse as a time saver when securing materials. When the time is propitious a carpenter shop should be built in conformity with the rest of the surroundings. The completion of the remodeling of the cars, a more efficient use of labor and the decrease in the number of cars in service due to the new routing proposed will make it possible to reduce the cost of labor and materials as estimated in Table VI.

By reference to chart No. 8 on page 1086 it will be seen that in 1913, which may be taken as a typical pre-war year, 5.3 per cent of the operating revenue

TABLE IV—PRESENT OPERATING COST OF DIFFERENT TYPES OF EQUIPMENT, BASED ON MAY, 1923, EXPENSES

	Present Two-Man	Cost per One-Man	Car-Hour	Trailer
Power.....	\$0.281	\$0.188	\$0.188	
Maintenance way and structures.....	.338	.225	.282

Taxes.....	.194	.146	.146	
Total.....	\$3.007	\$2.034	\$1.965	

TABLE V—ANNUAL SAVINGS POSSIBLE BY CHANGES RECOMMENDED

	Annual Saving
138 two-man hours daily at \$1.658 each, equals \$229 daily x 365 =	\$83,600
70 one-man hours daily at \$1.009 each, equals \$71 daily x 365 =	25,900
2 trailer hours daily at \$1.002 each, equals \$2 daily x 365 =	730
Due to power saving devices.....	4,100
Shop readjustments (labor).....	14,800
Shop readjustments (material).....	12,700
Carhouse readjustments (labor).....	6,700
Total.....	\$148,530

TABLE VI—ESTIMATED ANNUAL SAVINGS AT SHOPS AND CAR HOUSE

Payroll reduction (shops)	\$14,800
Payroll reduction (carhouse)	6,700
Saving in materials	12,700
Total annual saving	\$34,200

was required to cover maintenance of equipment costs, while for the first five months of 1923 16.5 per cent was required. Similarly, in 1913 these expenditures represented 7.8 per cent of the total operating expense, while now they are 15.5 per cent or double. This account should be normally about the same percentage of the total expense.

A very considerable portion of the increase in recent

temporary shed to care for the increased work in connection with the remodeling of cars. The present carpenter shop structure will need rebuilding in a few years. By that time the company may expect to be on a better financial basis and a building should be constructed in conformity with the rest of the plant.

The material store house is located in the old power house across the street. This requires a walk of approximately 1,000 ft. when material is required. The rear portion of the middle section of the carhouse is little used except as a place to pile junk. It should be cleared out and used as a store room that will be readily accessible from the shops. The cost of making the store room changes should not be a great deal. The

Maps Showing Present and Proposed Routes on the Charleston Railway

years is, undoubtedly, due to deferred maintenance. Some of it is due to renewals and betterments to the present rolling stock. As there is no special reserve for renewals of this nature, these costs are being charged directly to operations.

ARRANGEMENT OF SHOPS

The general arrangement of the shops is shown in the plan on page 1084. They are well located with respect to the carhouse. The electrical, machine, blacksmith and paint shops are housed in the main brick structure. The carpenter shop, however, is a frame lean-to on the south side of the main building. This frame structure was recently enlarged by addition of a

saving in time and labor in routing the materials should soon repay this expense.

The machine tools are in good condition and with the remodeling of the cars finished any replacement is hardly justified at the present time. A shaper or a milling machine would be a time saver in turning out light work. A check on the number of operations that would be done on this machine with the normal maintenance work should be made and the cost compared with that of similar work done by present methods. It is probable such an investment would be justified.

A large portion of the woodworking machines were purchased in 1921, so there should be no need for additions at this time.

With the remodeling of the cars completed, a reduction in the shop force is contemplated, leaving just enough help to care for the current maintenance. The decrease in the number of cars in service, with the proposed routing in effect, will reduce the labor requirements still further. Fifteen men may be dropped from the payroll, with a weekly saving of \$364.50 from the present weekly payroll of \$791.10. With a smaller force, administrative duties will be easier and a closer check on the work will be possible.

Based on the five months ended May 31, 1923, the annual cost of materials for equipment maintenance is \$52,800. With the recommended routing effective the material costs should be reduced approximately in the same proportion as the number of car-miles operated, or an annual reduction in the material cost of \$12,700 may be expected.

The carhouse can also be operated with a smaller force and the weekly payroll reduced at least \$129.60. The adoption of all of the recommendations in this

report should be of permanent benefit to both the public and the company. The faster and better distributed service should stimulate business. Reduced congestion will benefit the general public as well as the car rider and the user of the automobile. The merchants and property owners will benefit from the enlarged delivery area and the better distribution of cars through the business district.

The plan will enable the railway to take an important step toward being self-sustaining, as with the plan herein effective a saving of \$148,530 in operating expenses can be made. Supplementing these economies, further steps may be taken to improve the net earnings of the railway in three ways: (1) By the people of Charleston patronizing the railway more; (2) by curtailing the proposed service and introducing further economies; or (3) by raising the fares.

The railway deserves more patronage as the low per capita earnings show. An increase of one dollar per capita, or 2 cents per week, would practically wipe out the deficit. The schedules and service proposed in this plan will readily care for 15 to 20 per cent more riders. A 13 per cent increase in the revenue passengers would enable the company to operate without a deficit. This may result from changes in population or from in-

creased riding. If from the latter alone the riding habit must go up from 130 to 147, which, although more nearly what it should be, is a considerable increase over the present.

To curtail the service from that which is proposed is not desirable if any other way out can be obtained. Economies other than those recommended are not desirable from a service standpoint.

At the present time a combination of increased fares and more patronage is a practicable solution. If a straight 7-cent fare for adult city passengers were adopted it is estimated that the railway revenues will be increased \$22,500 annually. Possibly the people of Charleston, when they understand this situation, will avail themselves of the service to a greater extent and thus tide over the necessity of either lowering the standard of service or of increasing the rate of fare above 7 cents.

Fares to be equitable must always be based on the cost of rendering service. High costs mean higher fares. As the costs recede the fares should do likewise. At no time, however, can any progressive community prosper with poor car service even though such service is tolerated by the public in order to secure a low rate of fare.

Capitalizing on the Coffin Prize

How the Chicago, North Shore & Milwaukee Railroad Is Turning the Winning of This Award to Good Account—Its Value as a Publicity Asset Is Being Fully Utilized in Newspaper Advertising, Window Displays and Company Publications—The Cover Design of the Prize-Winning Brief Has Been Reproduced on Dining Car Menus and on Attractive Souvenir Calendars

REALIZING the immense value of the Charles A. Coffin prize as a publicity and merchandising asset the management of the Chicago, North Shore & Milwaukee has been quick to apply it. The prize has also been put to use to give an incentive for building up a still greater pride and *esprit de corps* within the organization. The work already done has taken many different forms and still further applications are contemplated for the future.

As the first step in the program, the report of the Charles A. Coffin Prize Committee and the remarks accompanying the presentation of the prize have been made the basis of a series of large advertisements. Weekly insertions are being made in seven Chicago papers, five Milwaukee papers, two papers in Racine and two in Waukegan. In addition, these advertisements are being published in the local papers of Kenosha, Libertyville, Lake Forest, Highland Park, Winnetka, Wilmette, Glencoe and Evanston. This list includes practically all of the larger communities along the line.

A reproduction of the certificate of award was published first. This is being followed up by a series of seven advertisements quoting excerpts from the report of the committee. The seven advertisements are the same in form, the excerpts being inserted as shown in the illustration. Several of the other quotations are given below:

5. Because of improvements in construction practice, which have resulted in reduced first cost, reduced maintenance or greater reliability of service.

"Construction methods which are contributing to the general success of this company include new and better power station equipment; a program of rock-ballasting the entire system is 60 per cent completed; the old light rail is being replaced with 100-lb. rail and concrete and brick platforms are replacing wood at the stations."

—From Report of Committee on Award.

6. Because of particular success in conducting a safety program, and actually reducing the number and seriousness of accidents.

"In fostering greater safety in operation, this company has succeeded in reducing injury and damage claims to 1.32 per cent of the gross. The record was one accident per 16,081 car-miles in 1922. Lectures, safety meetings, safety recommendations. 'Safety First Car' and first-aid drill teams are part of the company's notable safety work."

—From Report of Committee on Award.

7. Outstanding accomplishments in development of good relations between management and employees.

"The fact that your company has secured the award of the Coffin Foundation is proof positive that the greatest spirit of co-operation must have existed among all men concerned, in the operation of your railway system."

—Mr. Emmons, Chairman Committee on Award.

It is expected that this series will be carried still further when the existing program is completed.

AWARD ALSO USED IN ADVERTISING NEW SECURITIES

The value of the award as a merchandising asset has also been applied in a campaign conducted for the procurement of new capital. Advertisements for the sale of the company's 7 per cent prior lien stock carry a reproduction of the front and back of the medal with the following statement beneath:

"Awarded October 11, 1923, for distinguished con-

won the first
CHAS. A. COFFIN MEDAL**

*at the Convention of the American Electric Railway
Association, October 11, 1923, Atlantic City, N. J.*

**1—Because of the particular initiative,
skill and enterprise manifested in
popularizing electric railway service.**

"From the representations of the winning company, the
committee finds, that on this property, there has been
carried to fruition most of the things that have been
talked about for years, as the remedies for various
troubles. On this property the remedies have not only
been talked about; they have been EXECUTED."
From Report of Committee on Award

**CHICAGO NORTH SHORE and MILWAUKEE
RAILROAD COMPANY**

An Example of General Newspaper Advertising in Which Excerpts
from the Committee Report Are Quoted

tribution to the development of electric transportation." These stock advertisements are in addition to the general advertising series and are being run in the same papers in which the general advertising campaign is conducted.

USED IN WINDOW DISPLAY AND COMPANY PUBLICATIONS

Very shortly after the award was made a large scale reproduction of the medal was prepared and was made the center of a window display in the Edison Building, where the company's offices are located. This display created a great deal of comment and interest and has since been moved to the terminal passenger station in Milwaukee.

The company included a description of the award in the "North Shore Bulletin," which is a monthly booklet prepared for circulation among patrons of the line and residents along its route. A similar item was published in the "High Ball," which is a monthly employees' publication, and in the Chicago Elevated Railway's publications, the "Elevated News" and the "High Line." The combined circulation of these papers is approximately 75,000 monthly.

Framed photographic reproductions of the certificate which accompanied the medal have been hung in the various stations along the company's route. Four-color reproductions of the cover of the prize-winning brief have been utilized on the covers of the dining car

menus, along with pictures of the front and back of the Coffin medal.

This colored cover design has been further utilized in making up a wall calendar. On each page of the date pad the front and back of the medal are pictured. It is planned to distribute the calendars as souvenirs at the opening of the new Wilson Avenue passenger station just nearing completion. In addition they will be mailed to a selected list of women representing various club and civic activities in the communities along the line of the road.

Bronze watch fob replicas of the medal have been made up. These are being distributed to employees and will also be used by the traffic department for distribution to employees of shippers doing business with the North Shore Line.

The management contemplates further application of the award in its general publicity program. It will probably be used as the basis for some of the posters with which the road has been so successful in the past in creating favorable attention and comment. By extension to its billboard advertising and to car card publicity it is expected that public confidence and good will toward the company can be still further stimulated through this evidence of merit presented by the industry of which it is a part.

How Economy in Current Was Obtained in El Paso*

THE business center of El Paso is very close to the river on the south, and the development of the city has been, therefore, confined to a northward growth. This growth has been made more difficult by reason of the fact that a chain of mountains extends through the northern part of the city, terminating just outside of the business district.

Innumerable hills and curves increase the kilowatt-hour consumption of the cars of the El Paso Electric Railway, as is evidenced by the fact that when an experiment with friction bearings was conducted by the company on the only level line operated, a lower power consumption was experienced with these cars than with the ball-bearing type on other lines. The total mileage of city lines in El Paso is 42.2 on a single track equivalent. Of this amount 22.1 miles is paved.

All of the company's cars are equipped with Economy meters, and a careful record is kept of each man's and each car's performance. An individual inspector is in charge of this phase of operation and keeps comparative records which are posted for the benefit of the men, and which also are published in the company's periodical, "Cactus Points." Where he finds that certain men are using more than the average amount of current, he studies the particular case and usually ascertains and corrects the cause.

The use of these meters by this Texas company, and the system in connection with them, have been instrumental in helping reduce the current consumed. This is shown by the average kilowatt-hours per car-mile for the system, which in 1920 was 1.765; in 1921 was 1.65; in 1922 was 1.52; and in 1923, based upon operation during a period of seven months, the kilowatt-hour consumption was 0.88.

Single Sash Windows of Unusual Height Admit Plenty of Light in the New Cars of the P-O Electric Company

Simplicity of Arrangement Features New P-O Cars

All Pipes, Wires, Switches, Engines, Etc., Are Inclosed in Cabinets—Advertising Cards and Luggage Racks Have Been Eliminated in Order to Improve the Interior Appearance—Woodwork Is of Mahogany

By Richard N. Graham

Manager of Railways Pennsylvania-Ohio Electric Company, Youngstown, Ohio

WITH the idea of creating a car which would bear the same relation to the ordinary interurban electric car that the coaches of the Pennsylvania-Ohio Electric Company bear to the ordinary bus, several departures from conventional practice have been made in the design of the new cars placed in service on Oct. 28. Three principal objects were sought. In the first place, simplicity of arrangement was desired for the purpose of facilitating cleanliness and improving the appearance of the interior. All pipes and machinery were, therefore, inclosed in cabinets. In the second place, the company wished to make the car as comfortable as possible for the passenger. In the third place, it was desired to speed up passenger movement, not only boarding and alighting but also within the cars, and doors and aisle were specially designed for this purpose.

The cars are operated from Youngstown to New Castle, a distance of 20 miles, and from Youngstown to Sharon, a distance of 15 miles. On these routes the headway is thirty minutes throughout the day and evening until midnight.

Both lines have comparatively heavy traffic, with considerable passenger interchange. This is particularly true of the Youngstown-Sharon line, where there are a number of very heavy loading points.

The new cars weigh 37,000 lb. and take the place of an older type interurban car weighing approximately 75,000 lb. Each car is equipped with four G. E. No. 265 motors of 35 hp. capacity. Four Westinghouse No. 317, 90-hp. motors constituted the equipment of the cars which are now being retired from service, but it is

expected that the new cars will handle the same traffic at the same schedule speed as the cars for which they are being substituted.

Because of the simplicity of the design and the quality of the material, the interior of the car has an unusually pleasing appearance. No stanchions of any kind are used in the car. Luggage racks and advertising signs have been eliminated. From the tops of the single sash windows up to the roof the sides are finished in genuine mahogany with a simple panel effect. The same finish is used for switch cabinets, controller, and the casing

Both Entrance and Exit Are Normally by the Front Door, but an Emergency Door at the Rear Is Also Provided

Mohair Velvet Seats Are Permanently Fixed at a Comfortable Angle, and the Interior in General Is Free from All Unsightly Mechanisms

for the engineer's valve. All switches are inclosed in a Detroit switch cabinet, which is painted to conform to the general scheme of decoration. It is placed under the left front window out of the way of the operator or passenger. The unsightly pipes leading to the engineer's valve are inclosed in sheet-steel cover, finished in conformity with the woodwork. Where it was necessary to install conduits inside the car body leading to the control apparatus, they were similarly inclosed. A feature of this car, therefore, is the minimum display of apparatus. The machinery is of no more prominence than in the interior of a well-appointed automobile.

In order to admit plenty of light, the bottom panel of the side frame was made unusually low, so that the lower part of the window sash is just opposite the elbow of a seated passenger. The cars were constructed with

Air Pipes Leading to the Engineer's Valve Are Hidden Behind a Sheet-Iron Shield

single sash windows, so that this sash might have greater height. All windows are plate glass. The bulkheads have been eliminated and the end windows and those opposite the doors were made of the maximum possible width and height. The result is that even on a cloudy day in a region which has an unusually cloudy climate the interior of the car appears bright and cheerful.

The elimination of the double sash and of all exposed piping or apparatus of any kind that would furnish a lodging place for dirt has facilitated the work of keeping the car interior clean and sanitary. Special washing facilities for these cars are now being installed in the inspection barn from which they are operated. For this purpose, a vacuum cleaning process will be used. As there is no provision made in the cars for bulletins, signs, notices, advertisements, or any other sort of publicity or propaganda, another fruitful source of dirt and trash has been eliminated. The company believes that the passengers should bring their own reading matter aboard the cars.

Carlines have been inclosed in mahogany cross-beams, while another beam runs longitudinally the full length of the car. Elsewhere the ceiling is finished in ivory white enamel. The ceiling thus has a beamed effect. This effect is carried out into the vestibule by a special sheet-metal vestibule hood, which also is finished in white enamel.

ADEQUATE LIGHTING AND COMFORTABLE SEATS

For artificial lighting at night, Brascolite lighting fixtures have been installed along the center of the roof. Each fixture contains a 93-watt light. In combination with the white enameled ceiling, already mentioned, these lights provide effective illumination, so that the passengers can read newspapers with ease at all points in the car.

Maximum comfort for the passenger is provided by the high back seats with deep spring cushions. The cars were arranged for single-end operation with the specific idea in mind of having a stationary seat that would have the proper pitch to be the most comfortable. Arm rests are provided on both sides of each seat. The seats are sufficiently roomy for two large men wearing overcoats to sit side by side in perfect comfort.

The floor is covered with battleship linoleum and the seats are upholstered in Chase mohair velvet of figured design. The color of the upholstery harmonizes with the mahogany trim. The operator's curtain corresponds in color and appearance to the upholstering of the seats.

An Ohmer fare register is installed on a mahogany cabinet containing pigeonholes for transfers and the operator's reports. Space is provided there also for two electric lanterns, one with a red bull's-eye and one with a white bull's-eye, which are used by the operator for signaling purposes instead of oil lights.

Ingress and egress of passengers are accomplished through a large double door at the front end. There is also an emergency door at the rear which can be opened by passengers whenever an emergency stop is made. The aisle is unusually wide, and the farebox is located so as not to interfere in any way with the free movement of passengers.

A single seat just back of the front door was originally included in the design, but this has now been eliminated and the sand box under this seat has been inclosed in a mahogany cabinet.

Keeping the Cars on Schedule*

Organization and Operation of Dispatching System of Kansas City Railways Is Briefly Told—
Effective Check of Car Operation in the Field Has Served to Produce a High
Standard of Service—Company Police Department a Great Aid

IN ORDER to correct unavoidable disarrangements of service at their very inception, the Kansas City Railways has developed a dispatching system which has contributed materially to the building up of increased patronage and has resulted in other direct and indirect economies coming from the more efficient utilization of equipment with the accompanying saving in platform expense.

This dispatching system was laid out on a basis that would provide vigilant supervision and prompt action through immediate contact with service by men in the field. Besides endeavoring to make efficient schedules, the company has a system of control through its dispatchers and inspectors which provides forty-five men on the street during rush hours to assist in traffic regulation, proper spacing and prompt action in case of imperfections in the service. Service irregularities have been reduced to a minimum, where prompt action is possible through the speedy transmission of intelligence and dispatching of relief for such troubles as wrecks, trolley breaks and accidents. Incidentally, all emergency trucks and similar equipment carry police sirens.

The dispatching organization comprises a chief dispatcher and three assistant chief dispatchers, located at the main office, who, in three shifts, carry the work continuously through twenty-four hours, and dispatchers, inspectors, company police, motorcycle inspectors, division officials.

PRIVATE TELEPHONE SYSTEM GIVES DISPATCHER DIRECT CONTROL

The dispatching desk is connected directly with twenty-six dispatchers' booths located at strategic points over the system. In addition, the dispatcher has direct telephone communication with pole box telephones located at fifty-one intermediate points on all lines of the system. All these telephone connections with the dispatcher's desk are over private wires.

The assistant chief dispatchers keep a record of all the calls from field dispatchers, inspectors, company police, division officials, etc., listing all delays of over five minutes, all accidents and all occurrences pertinent to the operation of the system. These are tabulated and a typewritten report for each day is on the desk of the superintendent of transportation by 7 o'clock the following morning. These men also carry out the dispatching orders of the chief dispatcher, reroute cars, fill in spaces, handle emergencies, dispatch emergency tower wagons, trucks or wreck cars, police or medical aid, and act as the nucleus for transmitting orders and receiving reports for the entire system.

The dispatchers located at the twenty-six booths scattered over the system at strategic points are on duty eighteen hours a day. They check and correct on the street irregularities in headways and schedule distortion. They report to the chief dispatcher all delays or

One of the Twenty-six Dispatchers' Booths Located at Strategic Points on the Kansas City Railways System

These booths are electric lighted and heated and equipped with telephone, schedules of all lines passing the booth, information of the city and the system, and with miscellaneous equipment such as switch bars, spare trolley poles, fuses, replacers, pick-up sticks, jacks and chains, light repair kit and fire extinguishers.

failures of over five minutes. They keep a typewritten record of the time of arrival and the load of every car passing the stations. They observe and report any defects noted in passing equipment to the assistant chief dispatcher, with the result that defective equipment is promptly removed from service. In addition to the duties already mentioned, these men act as public information stations, sell tokens and tickets and are in every respect branch offices of the main office for the convenience of the public.

The inspectors, dressed in a uniform which is distinctive from the trainmen's uniform, are stationed at heavy points during the rush hours. They assist in loading and moving cars and act as traffic officers when necessary. They transmit orders to trainmen, check up defective equipment, report violations of rules, assist the public in every way possible and see that cars

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

are given preference over vehicular traffic at all intersections. These men are all commissioned police officers and they act in perfect co-operation with the police department, by which they are recognized. During the non-rush hours, the inspectors travel over the lines constantly, looking for improper operation, schedule distortion and keeping in constant touch with the chief dispatcher through the pole telephones.

In addition to the regular inspectors, the company employs four motorcycle inspectors, working in two shifts of ten hours each. Their duties and authority are the same as those of other inspectors. They function particularly in cases of fire, accidents or other emergencies. Their motorcycles are equipped with sidecars so that they can transfer trouble men, division officials and others rapidly and can carry emergency kits. They also assist in handling parades. They are commissioned officers and wear a uniform similar to that of the motorcycle police and their cars are equipped with police sirens.

THE RAILWAY HAS A POLICE DEPARTMENT

The Kansas City Railways also has a police department which is said to be unique among street railway companies. It consists of a chief and a day and a night captain and fourteen officers. The police department is on duty twenty-four hours a day. Use is made of a fast automobile equipped with a police siren, and every man in the department is an ex-police department officer, commissioned by the city and given equal authority and rights as regulation police officers. These men answer accident calls, handle crowds, secure names of witnesses, assist in caring for the injured, keep the streets clear. Their police authority renders them invaluable in such emergency cases. They assist in clearing up parades and make arrests of traffic violators or disturbers, if necessary. In times of heavy traffic movement at parks, ball games, parades and other special events, they report to the chief dispatcher and assist in distributing the load, preserving order and in exercising general police authority. These men are also used as guards and watchmen at all points where money is handled.

In addition to the regular company police department, there are 115 police commissions in the transportation department. These were granted by the police commissioner and the railway employees so commissioned are regarded by the police department as regulation officers with power to make arrests, handle traffic and perform other duties of a similar nature.

The entire dispatching organization works in conjunction with the traffic checking department of the railway. The daily reports of car arrival time and loads kept by each dispatcher, combined with the reports of the traffic checking department, give a daily traffic check and survey of every important line. As a result, the superintendent of transportation and the general manager have on their desks each morning the loading check, car receipts, car-mile receipts and total receipts of every important line, together with the platform operating expense of each line. Thus the schedules may be and actually are adjusted daily, as occasion requires.

The results of this comprehensive dispatching system are readily apparent. The company states that in spite of hills, narrow streets and vehicular congestion, it is able to maintain high service standards with delays reduced to a minimum. Train crews are constantly

checked, discipline is better enforced, and accidents and emergencies are more expeditiously handled as a result of the dispatching system.

Company Does Paving at Cost for City*

AN INTERESTING example of the way in which an electric railway company, by means of its trained organization, can be of help to a city government is shown by an incident which occurred in Colorado Springs a little more than a year ago. This city of about 40,000 inhabitants decided to put through a considerable job in paving, which the city engineer estimated would cost approximately \$1,100,000. Four of the principal streets of the city were involved, and on one of these the Colorado Springs & Interurban Railway maintained a double-track railway about 3 miles in length.

The city advertised for bids, but when they were received they were found to be in excess of the engineer's estimates, except for a small proportion of the work. The specifications for the rest of the work were then changed and new bids were requested, but these also were considered unreasonably high by many of the citizens. The railway company then made the following offer to the city, to wit: If the Council would reject all the present unsatisfactory bids, the company would do the work on that part of the undertaking for \$5,000 less than the lowest bid which the city had received up to that time. It agreed also in separate provisions to do the work without profit of any kind, that the cost would not exceed that already mentioned, and finally that while it would have to purchase certain equipment to do the work, this equipment would be considered a part of the cost of doing the work and be turned over by the company to the city at the expiration of the contract.

This offer was accepted, and when the contract was finally completed, which was about Nov. 1, 1922, it was found that the company had saved the city \$200,000 in cash and had turned over to the city the equipment which it had purchased at a cost in excess of \$96,000.

Incidentally, the company found that the work that it had to do itself in connection with its own track in this repaving undertaking had been done at a cost of some \$30,000 less than the lowest bid made by any contractor, and that it had obtained a much better class of work.

Transportation Conference

A CALL for a national conference on transportation, to be held in Washington, Jan. 9, 10 and 11, was issued on Dec. 25 by Julius H. Barnes, president of the Chamber of Commerce of the United States. The discussions at this conference will relate to recent reports of committees of the national chamber on the following phases of the transportation question: (1) Governmental relations to transportation; (2) railroad consolidation; (3) readjustment of relative freight rate schedules; (4) highways and motor transport; (5) co-ordination of rail and water service; (6) taxation of common carriers. Abstracts of the committee reports, 4 and 6, which relate more closely to electric railways than any of the others, were published on pages 903 and 905 of the issue of this paper for Nov. 24, 1923.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

Washable Seat Covers Prove Popular on Interurban Line*

A CAUSE for complaint among patrons of the Northern Texas Traction Company, Fort Worth, with regard to the interurban cars used to be that the leather backs of the car seats in many cases soiled their clothing. To overcome this the company has equipped all the interurban cars in limited service on the Fort Worth-Dallas line with slip-on covers which extend over the seat backs for a distance of 12 in. from the top.

These covers are made of regular automobile seat covering, duck No. 2430. It requires 1 yd. 4 in. of the material at 35 cents per yard to make one cover and the labor and other costs are about 20 cents, making each one cost approximately 59 cents. The average life of a cover is several months, and during the year they have been in use only \$30 has been spent for repairs, outside of the regular replacement of worn-out covers.

A contract has been made with a local laundry to wash these covers at 1 cent each and every set is washed once in fifteen days. These covers give a pleasing effect to the car interior as well as prevent dirt being rubbed off the seats onto the clothes of the passengers. Many favorable comments have come from patrons of the line, and the improvement has increased the popularity of the Fort Worth-Dallas limited service with only a very small increase in expense.

Prizes for Helpful Suggestions*

TWO methods of encouraging helpful suggestions from employees for the improvement of the service or more economical operation are being practiced by the Colorado Springs & Interurban Railway. One of these is to offer prizes for the best suggestions of this kind submitted by employees. An offer of this kind, with first prize of \$100, second prize of \$75, third prize of \$50, and fourth prize of \$25, was made by this company in 1923. Prizes are awarded at the end of each year by a majority vote of the board of directors. The vote of the directors is taken without knowledge as to who made the suggestions.

All suggestions must be in writing. A number have already been received and some have been adopted and put into force. The men are taking great interest in the plan.

A second method of stimulating interest in improvements in the practice of the company was begun in

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

February, 1923, in the form of monthly luncheons for the superintendents and the foremen with the president of the company. At these luncheons the foremen read papers prepared by themselves upon the work of their respective departments, and this is followed by general discussion, either of the points brought up in the paper or of any other matters that the foremen feel may be of interest to the company. The papers are typewritten, and a copy is delivered to each of the directors of the company. It has been found that the foremen at these meetings will make suggestions for improvement of the service and economies in operation which they might otherwise hesitate to make to the superintendent for fear that such suggestions might be considered as criticisms of his management. Another benefit from the plan is that the directors of the company gain a better understanding of the details of the operation of the system through the reading of these papers than they might otherwise have.

Piling Coal with Bus and Trolley

MOST people who use coal in the Eastern States, whether individuals or company officials, did what they could last summer to have a sufficient supply for this winter. Among other companies, the Connecticut Company put in a quantity of coal for power and heating purposes.

A visit in July to the Mount Vernon Street carshops in Hartford of the Connecticut Company disclosed a novel method of piling the coal purchased for heating purposes in those shops. A supply of from 600 to 700 tons was being put in outside storage, and after being discharged from the coal wagons had to be piled. This might have been done by hand or with a scoop drawn by horses, but a much more rapid and economical way was being followed with a scoop operated by a car and bus. This shovel was connected to a cable which ran over a sheave attached to a pole near the top of the coal pile and then over a sheave near the bottom of the pile. By this cable the scoop could be hauled to the top of the coal pile. Another cable attached to the scoop passed over a sheave near the bottom of the pile. This enabled the scoop to be pulled down. One of these wires was connected to a trolley car and the other to a bus.

The only operators required were one for the trolley car, one for the bus, a man at the bottom of the coal pile to fill the scoop and a man at the top of the coal pile to empty it.

The trolley car by backing would then haul the scoop to the top of the pile, and after it was emptied, the bus would haul it down again.

The Car Pulls the Shovel Loaded with Coal to the Top of the Pile and the Bus Pulls It Down

Through Trains Out of Indianapolis

TWELVE through passenger routes are now being operated out of the Indianapolis joint terminal. The following table gives these routes, running times and number of trains daily:

Through Trains from Indianapolis to	Miles	Running Time Hours, Minutes	Trains Daily Each Way
Fort Wayne via Anderson, Muncie and Bluffton (Limited).....	126	4 50	7
Fort Wayne via Anderson, Muncie and Bluffton (Hoosierland).....	126	3 55	1
Fort Wayne via Kokomo, Peru and Wabash (Wabash Valley Flier).....	136	4 10	1
Goshen, Ind.....	160	5 20	1
Louisville, Ky*.....	117	3 45	7
Terre Haute, Ind.....	72	2 25	7
Marion, Ind. (Limited—connecting at Anderson).....	72	3 30	12
Marion, Ind. (Marion Flier).....	72	2 40	1
Lafayette, Ind.....	70	2 35	7
Richmond, Ind.....	70	2 35	7
Muncie, Ind. (Limited).....	57	2 20	16
Muncie, Ind. (Muncie Meteor).....	57	1 50	1

Greensburg, Ind.....	49	1 45	12
Dayton, Ohio (Way).....	109	4 15	4
Dayton, Ohio (Limited).....	109	3 55	3

*Also six trains connecting at Peru for Goshen.

Automobiles Flatten Traffic Curve

MANY railway managers realize that the large business which they used to do in the summer has gone to the automobile, but all perhaps have not definitely determined the extent to which their traffic has been so affected. The influence on one road, the Eastern Massachusetts Street Railway, is shown by the accompanying chart. This chart gives the traffic for each

Chart Showing Seasonal Variation for a Number of Years on System of Eastern Massachusetts Street Railway

month of several years, in percentage of the average business during January, February and March of that year, for the company mentioned and for its predecessor, the Bay State Street Railway. The years whose traffic is thus charted are ten in number, selected at intervals from the past eighteen years.

As will be seen, the chart shows a constant decrease in ratio of summer business to winter business. Curves for individual lines naturally would show some variation from the combined curve, as the Eastern Massachusetts system is made up of a number of city lines, as well as suburban lines, but the effect mentioned is shown

in practically all of them to some extent. The curve is affected somewhat, of course, by the discontinuance during the past few years by the trustees of the Eastern Massachusetts Street Railway of some 200 miles of track. Probably the summer peaks on these lines has been higher than on the rest of the system.

Education in Milwaukee

Thirty-one Courses Are Offered by the Employees' Benefit Association This Year—Cost of the Work Is Borne by the Association

FOR a number of years the Employees' Mutual Benefit Association of the Milwaukee Electric Railway & Light Company has conducted classes on various topics directly or indirectly connected with electric railways and electric lighting. The courses are under the direction of Prof. H. A. Rowland, educational director of the company.

This year the bulletin announcing these courses showed thirty-one courses altogether, divided as follows:

In mathematics: arithmetic review, advanced arithmetic, shop arithmetic, algebra, trigonometry, calculus and calculating machines.

In electricity: direct and alternating current principles, electrical experiments, electric motors, transformers, rotary converters and rotary condensers, storage batteries, high-voltage problems, electrical instruments, the electrical distribution system, car electrical equipment.

In mechanical subjects: blueprint reading, sketching, lettering and curve drawing, the automobile.

In power plant courses: power plant engineering No. 1, steam engines, steam turbines, power plant engineering No. 2, power plant engineering No. 3.

General: psychology, economics of labor, English for the foreign born, English for engineers, quiz class in accounting.

Most of the lessons are held in the evening, but there are some starting at 12:30 p.m. The class period is usually one and one-half hours.

Any member of the benefit association is eligible to join the classes, but in some of the more advanced work the primary course is required. Certificates are granted to those who complete courses, but to secure a certificate a grade mark of more than 70 per cent and an attendance record of more than 80 per cent of the class periods are required. It is also expected that each student will do a certain amount of home work in addition.

Professor Rowland is assisted by thirteen instructors, almost entirely college graduates who are ambitious to help in this kind of work. All are members of the Employees' Mutual Benefit Association and are employed by the Milwaukee Electric Railway & Light Company in regular operating positions. The cost of carrying on this work is borne by the association.

The pamphlet program announcing these courses for the 1923-24 season carries a number of inspiring slogans, such as:

"Things don't turn up in this world until somebody turns them up."

"A competent employee can't be held down nor an incompetent one held up."

"The man who only half tries doesn't even make half good."

Maintenance of Equipment

Rehabilitating Motors at Spokane*

AN EXTENSIVE system of rehabilitating motor equipment has been under way at Spokane, Wash., since the consolidation of the two street railway systems in that city. The management determined that the most essential problem was the building of the worn housing fits in motor cases, as most of the bearings required shimming to hold them. The method followed for doing this was by electric welding, an average of about $\frac{1}{4}$ in. of solid steel being placed in the housing fits.

After this building up is completed, the motor shell is set up in a McCabe 72-in. double spindle lathe. An accompanying illustration shows a G.E.-80 motor in position for machining. The plate on the carriage is part of the equipment of the McCabe lathe. The jigs for holding the axle were manufactured in the company's shops and are bolted to the carriage plate. Perfect alignment is secured by putting a piece of axle in these pillar blocks and then bolting the shell in with the bearings in position.

There are two upright bolts with running threads on the back of the plate. These go through the motor bolt holes in the cases. By using these the casing is brought up to its proper position. A sheet-iron templet is used on the pole pieces in order to obtain proper centering. When the crossfeed of the lathe is locked in proper position, proper gear mesh is assured, as the distance between the center of the axle and the armature shaft is fixed. The boring bar is provided with two high-speed cutters so that both bearing fits are bored out at once.

It requires one man about half an hour to change from the regular lathe equipment to the set-up necessary for boring out motor shells, and in addition it takes another half hour to set up the shell. The top half of the case is set up in the lathe with the bottom half of the bearing

Set-Up for Reboring G.E.-80 Motor Shell

bolted to it. After the shell is in position, it requires about two and a half hours to bore a casing.

In the welding particular care is taken to provide a deposit of sufficient metal so as to be sure that a solid clean cut can be taken. About 10 lb. of steel welding rod is used per shell, which makes a total cost, not including the cost of welding current, of about \$5.25. This includes the machinist's time for boring. Any additional welding or reboring of bolt holes would be an additional cost. The cost of reboring shells, re-insulating fields and putting other motor equipment in proper condition for G.E.-80 motors runs between \$12 and \$15 per motor. All bolt holes that show wear are filled up and rebored to standard size.

A heavy boring bar can be seen in a sling at the back of the lathe in the accompanying illustration. This bar is used for boring out Westinghouse 101-B motor shells. The company is standardizing on one size for its bearings, and so the Westinghouse 101-B housings are welded up and the large hole in the end of the case is rebored to a smaller diameter. All loose bolt holes are welded up and re-

bored. The cost of welding, reboring, overhauling and insulating a Westinghouse 101-B motor, other than work on armatures, is about \$32. All lathes are served by jib cranes similar to the one shown in the illustration over the wheel lathe in the background.

Aluminum Tubing Covers Iron Stanchions*

ALL of the cars of the Northern Texas Traction Company, Fort Worth, have platform stanchions of iron pipe, painted on the outside with a good grade of paint. Nevertheless, in a short time the paint wears away, especially where the passengers continually grab at the same place on the stanchion. After the paint has worn off, the bare pipe presents a dirty appearance in contrast to the painted part. Furthermore, when a woman wearing white gloves boards the car she naturally grabs the stanchion, and the gloves become soiled. This has caused

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

*This article is based on material included in the brief submitted to the Charles A. Coffin Prize Committee of the American Electric Railway Association by the company named.

The Iron Pipe Stanchions in the Cars of the North Texas Traction Company Are Covered with Aluminum Tubing

many complaints, which, though they are trivial, the company has sought to eliminate.

Through the co-operation of the Aluminum Company of America, aluminum tubing has been secured which just slips over the outside of the pipe stanchion. Every platform stanchion which the passenger is likely to grab in boarding or leaving the car has been covered with the aluminum tubing for a distance of several inches above and below the common place of taking hold. The result is that the stanchions always present bright clean surfaces, and instead of complaints the company has been receiving a great many commendations from its patrons since the change.

Painting Cost Reduced More than Half

A CHANGE has been made in the painting methods used by the Spokane United Railways, Spokane, Wash. The previous practice was to scrape and remove all loose paint from the car body and then give a coat of primer, after which the surface was puttied and sanded so as to apply a second coat of primer. This was followed by two coats of flat color, a coat of rubbing varnish, and a coat of heavy car body varnish. This method of painting cost about \$140 per car.

The enamel process of painting is now used. After the usual method of scraping and removing all loose paint from the car body, a coat of primer is applied. This is then glazed, puttied and sanded, and another coat of primer is put on. This is followed by very light sand-

ing and later with two coats of Fuller's cab enamel. This process costs but \$65 per car and is found to be more serviceable than the paint and varnish formerly used.

New Equipment Available

A Steady Rest with New Features

FOR machining operations such as facing, boring and turning, performed on the end of material, a steady rest has been developed by the McCrosky Tool Corporation, Meadville, Pa. The work is held between three rollers running on roller bearings. The rollers move toward the center simultaneously upon closing the jaws, the work having been in-

Machining Operations Are Simplified by Means of This Steady Rest

serted from the top with the jaws open. The handle end of the screw is dropped into a slot in the front jaw and the device is tightened by turning the screw. The device can be easily attached or removed from the lathe, but when once adjusted for the position of the centers on the lathe on which it is used no readjustment is required. A large range of diameters can be handled and the operator may go from the smallest to the largest diameter without any adjustment except a few turns of the tightening screw.

High-Speed Electric Drill for Small Work

A NEW model electric drill of $\frac{1}{8}$ in. capacity and with side handle construction is being put on the market by the Hisey-Wolf Machine Company, Cincinnati, Ohio. This drill is equipped with a universal motor for operation on either alternating or direct current. This is a high-speed

A Junction Box at Bottom Facilitates Cable Repairs

machine and is for use in either wood or metal drilling and reaming operations.

A cable junction box is provided on the frame. This is a new feature and permits cable repairs and renewals without dismantling the machine. The operating and controlling switch is conveniently located in the side grip handle.

The machine is provided with ball bearings throughout, and these, together with the gears and other moving parts in the gear end of the machine, are supplied with lubrication from the gear transmission case. The ball bearings on the top head are packed with grease. The machine is furnished with 15-ft. electrical conducting cable, fitted with a suitable attaching plug and Jacobs drill chuck for holding straight round shank drills up to $\frac{1}{8}$ in. diameter. A grinding wheel attachment with 4 $\frac{1}{2}$ -in. x $\frac{1}{2}$ -in. wheel can be supplied on order.

The News of the Industry

Queens Needs Line

Committee to Consider Problem of Meeting Transit Demand of Fast Growing Section

The need for a new four-track main line subway through the "physical" center of Queens Borough was presented to the Transit Commission, on Dec. 18, by a joint committee composed of the transit committee of the Queens Chamber of Commerce and the executive committee of the new Queensboro rapid transit committee. Such a line should in the main follow the line of Queens Boulevard, the several speakers said, through Jamaica, Hollis and Queens Village to the city line.

The principal speakers on behalf of the Queens representatives were: William A. Jones, Jr., chairman of the Queensboro rapid transit committee, and Robert W. Higbie, chairman of the Queens Chamber of Commerce rapid transit committee.

OTHER EXTENSIONS NEEDED

Chairman McAneny told the visitors that along with construction work now under way must go the new crosstown line and the Washington Heights extension, and after that, if an agreement were reached between the city and the Brooklyn-Manhattan Transit Company, must come the subway extension of the Fourteenth Street-Eastern line, which the company has agreed to operate, if the city constructs. Chairman McAneny said:

Then there must come the matter of a new entrance to Brooklyn, perhaps via Livingston Street, and also the matter of the solution of the problem in Forty-second Street, Manhattan.

Beyond that program we all feel, I think, that there must come a new entrance to Queens. There are no doubt several lines required in Queens; just what order they are to come in is, of course, something that must be determined. Queens is well up to the front in the new program and it would be well, I think, to fix the sequence which the several projects for Queens shall take.

RECOMMENDS CONFERENCE

He suggested that the two Queens committees name a committee of engineers to confer with the commission's engineers and experts. This, it was stated, had already been done. The Queens engineering committee is headed by John C. Brackenridge, a well known engineer.

Mr. Higbie stated that whatever form the relief for Queens should take, any new line should be a through one, direct to lower Manhattan. He suggested that Sixth or Eight Avenue, Manhattan, be reserved for a route for a Queens line.

Chairman McAneny pointed out that it would be folly, with the limited num-

ber of north and south thoroughfares that there are in Manhattan, to reserve one exclusively for a Queens line, but explained that in the new subway plans provision is made at some points for six and eight tracks, which will provide entrance capacity for Queens and other lines.

In reply to a question of Mr. Higbie as to whether a spur of the Fourteenth Street-Eastern line might not be built to tap Ridgewood, Commissioner Harkness said that the decision to construct the eastern end of the line as a subway opened for discussion the possibility of whether that line might not be routed through Ridgewood.

Los Angeles to Ask Commission to Fix Viaduct Share Cost

The city and county governments of Los Angeles have decided to ask the California State Railroad Commission in the form of an application to establish the equitable rate for the total of the cost of six viaducts to be constructed over the Los Angeles River to be paid by each of the interested and benefited parties. It is proposed that each of the interested parties would pay an equal share of the cost, although the pro rata for each viaduct would be different. For instance, the Los Angeles Railway lines would not use the Aliso Street viaduct and probably would not use the Ninth Street viaduct for years to come. Therefore, it is to be determined whether the Los Angeles Railway would be relieved of a share of the cost of the two proposed structures. The cost of the track relocation work is estimated to be \$1,200,000.

The Los Angeles voters on June 5 approved the \$2,000,000 bond issue as its share of the expense of constructing these six viaducts over the Los Angeles River to separate the grade of steam road lines operating on the east and west banks of the river and car lines and highway traffic. This improvement was proposed with a view to relieving traffic congestion and extreme traffic delays to riders delayed from fifteen to fifty minutes daily by operations of steam road trains at points of crossing at Los Angeles River bridges.

The City Engineer of Los Angeles estimates the total cost of six viaducts, including the expense of relocating the railroad tracks on both sides of the river, would be between \$5,000,000 and \$8,000,000, and that each of the interested parties, namely, the city of Los Angeles, county of Los Angeles, Santa Fé Lines, Union Pacific System, Los Angeles Railway Corporation and Pacific Electric Lines are to bear their proportionate expense.

Jitneys Meet Doom

Alabama Supreme Court Hands Down Decision Making Taxicab Operators Liable to Arrest

The City Commissioners of Birmingham, Ala. have won what is believed to be a final victory against the jitneys, in a decision handed down by the Alabama Supreme Court Dec. 22.

For the past few weeks the Birmingham Interurban Taxicab Service Corporation has been operating jitneys under an injunction against the city. The decision of the Supreme Court dissolves this injunction, thus making the operators of automobiles of this company subject to arrest by Birmingham officers.

Some time ago the city of Birmingham enacted an ordinance against jitneys operating within four blocks of a street car line in the downtown section of the city and placing an annual license tax on each jitney of \$100. The jitney men asked for an election by the people on this ordinance. The election was granted and the jitneys were defeated.

LICENSES REFUSED

Then the Birmingham Interurban Taxicab Service Corporation was organized by former jitney owners and it applied to the city for taxicab licenses. The cars of this company were inspected by W. B. Cloe, Commissioner of Public Safety, who reported the automobiles unsafe and otherwise unsatisfactory for taxicabs. On the strength of this report licenses were refused. The taxicab company then applied to Judge Roger W. Snyder of the Circuit Court, who granted a temporary injunction. On motion of the city, Judge William M. Walker dissolved this injunction two days after it was granted. Then the taxicab company applied for a reinstatement of the injunction and this was denied. The taxicab people then applied to Judge B. M. Miller of the Supreme Court, who reinstated the injunction pending the appeal to the Supreme Court.

Now the Supreme Court affirms the decree of Judge Walker, which dissolves the injunction and leaves the operators of these so-called taxicabs liable to arrest by the city for doing business without a license.

Another case, in favor of the city and against the Boyles Transit Company, was decided by the Supreme Court also on Dec. 22. In this case the transit company was operating automobile buses to Boyles and Tarrant City. This company asked an injunction against the city from requiring it to give bond for operating these buses. Some time ago an ordinance

was adopted by the city which was in the nature of an agreement between the city and the Birmingham Railway, Light & Power Company, requiring that interurban buses operating through sections served by street cars be required to give bond. An injunction against the city in favor of the transit company was granted in the Chancery Court. The city appealed to the Supreme Court, and the Supreme Court upheld the city settlement ordinance.

The automobiles operated by the Birmingham Interurban Taxicab Service Corporation all carried the sign "Taxicab for Hire." But they picked up passengers along the streets wherever they could get them, charged a fare of 10 cents, and operated only on certain streets. Thus in reality they were the old jitney, only under the name of "Taxicab."

City officials say, now that the Supreme Court has ruled on these two cases, they will put the law into effect immediately. Thus the jitney in Birmingham seems to have met its doom at last, after more than a year of fighting their battles in the courts and at the polls.

Plan to Raze New York Elevated Approved by City

The Board of Estimate of New York City has ratified the action of its committee of the whole in approving the plan of Borough President Julius Miller of Manhattan to raze the Sixth Avenue elevated railroad structure from Trinity Place to Fifty-third Street and Sixth Avenue and to build a subway to take its place.

Two resolutions presented by Mr. Miller have been adopted formally. One of these directed Corporation Counsel George P. Nicholson to draft a bill for introduction in the Legislature to permit the city to acquire the elevated structure. The other resolution called for a conference with the Transit Commission in regard to plans for the subway.

City Desires Staten Island Lines Despite Promises to Improve

According to John A. Lynch, president of the Borough of Richmond, New York City, electrification of approximately 30 miles of steam railroad in Staten Island has been practically promised to Acting Mayor Murray Hulbert and other members of the Board of Estimate by President Willard of the Baltimore & Ohio Railroad, operating the Staten Island Rapid Transit Railway.

Despite this it is expected that plans will be pushed for the city to buy, electrify and operate the Staten Island lines.

Mr. Lynch, said that Mr. Willard had assured city officials that the railroad also would extend its lines from Arlington to Tottenville, a distance of about 8 miles, and build spurs to industrial plants.

If the city electrified and operated

the steam railroads, Mr. Lynch said, a reduced fare would result. He pointed out that on the line from St. George to Arlington, and from St. George to South Beach, a distance of about 9 miles, an 8-cent fare was charged, while on the main line from St. George to Tottenville, a distance of 15 miles, the round trip fare was 79 cents for ordinary passengers and 22 cents for commuters. He said it would be possible for the city to operate the lines on the basis of a 10-cent fare. He estimated that \$10,000,000 would be the cost of electrification, ventured no estimate of what it would cost to purchase the railroad lines.

He added that he had already requested the Corporation Counsel to prepare an enabling bill for the acquisition of the lines on Staten Island, to be presented early in the next Legislature.

Railway Matters Before Council

Toledo Fares May Go Up—Jitney, Trolley Bus and Maintenance Allowance Matters Present Problems

An increase in fares at Toledo is expected to be announced as a result of deficits which have brought the stabilizing fund of the Community Traction Company, to the low level of \$56,868 as of Dec. 1. The raise would be to straight 7-cent fare from 7 cents cash with six tickets for 40 cents.

The deficit for operations in the month of November as reported to the street railway board of control was \$9,997 and for the month of October it was \$19,256.

Although a surplus will probably be earned in December Commissioner Cann is doubtful about keeping fares at their present level. It will be up to the company to move to change the fare. Some time ago the stabilizing fund fell below \$300,000, but the railway officials on advice of Street Railway Commissioner Cann, postponed action. The stabilizing fund was growing monthly until a raise in wages in the spring brought about a return to red figures.

After the first of the New Year a new City Council with members considered to be especially favorable to traction development in accord with the Milner settlement plan will be at the helm in city affairs. In consequence some important developments are expected. Recommendations have already been made looking to the elimination of buses which compete with the railway. There is also strong possibility of the establishment of a trolley bus cross-town line. Equipment of this type has been investigated by the commissioner and some members of Council and all appear to be favorable to the trolley-bus plan. One-man operation may also be resumed as a means of reducing expenses. Furthermore there may be some changes in the allowances for maintenance for 1924 and a revision of power rates.

In November the gross revenue of the railway was \$323,510, an increase

of \$17,325 over the same month a year ago. Operating expenses in November, 1923, were, however, \$21,286 greater than for the similar month in 1922 due to higher maintenance charges and increased wages.

The first eighteen days of December showed an increase in revenue of \$9,548 over the similar period last December.

For the year soon to end the \$640,000 set up for maintenance was overspent by \$15,000.

International Wins Suit Against Customs Collector

United States District Judge John R. Hazel in Buffalo has handed down a decision making permanent the temporary injunction granted some time ago in the case of the International Railway, Buffalo, against the United States customs collector at Buffalo, who has supervision over the Niagara Falls and Lewiston bridges of the International between the United States and Canada. The United States customs department threatened to close the two bridges to all traffic Sundays and holidays unless the traction company guaranteed the payment of overtime wages to the United States customs inspectors assigned to duty on these bridges across the Niagara River at the International boundary line.

It was the contention of the International Railway that it is the duty of the United States Treasury Department to pay the inspectors for overtime work. The order of the customs department would force all incoming passengers from Canada via the International Railway to deposit their hand baggage and packages at the customs offices and claim them the day after Sunday or holidays. The International Railway claimed that this would mean the virtual closing of the bridges and would cripple their business with tourists on the busiest days of the year.

A temporary injunction was handed down by Federal Judge Hazel restraining the customs collector at Buffalo from putting the proposed regulations into effect. Further arguments were heard by the court and now the temporary writ has been made permanent.

Increase in Wages for Findlay Employees

Employees of the Toledo, Bowling Green & Southern Traction Company, Findlay, Ohio, on January 1 will receive a flat increase of 3 cents an hour in wages. This was provided in a recent pact between employees and the company which gave the men in freight service an increase of 6 cents an hour and those in passenger service a boost of 4 cents an hour from Aug. 16 to Jan. 1, 1924.

The rates provided 47 cents an hour for the first three months service, 49 cents for the next nine months and 53 cents thereafter in the passenger service. Freight men have a scale of 49, 51½ and 55 cents for like periods of service. The new increases will be added to these amounts.

News Notes

Will Represent in Legislative Work.

—Henry W. Killeen, attorney for the International Railway, Buffalo, has resigned from the law firm of Penney, Killeen & Nye effective Jan. 1, 1924, to become head of a new law firm to be known as Killeen, Sweeney & Kelley. Mr. Killeen will represent the International in legislative work in Albany. Thomas Penny and Judge Nye will continue to represent the International in the trial of negligence cases and many of the smaller cases will be given to other attorneys for trial in the courts.

Men Get Safety Bonus.—One half the amount estimated saved in avoiding accidents during the past three months, aggregating \$4,381, has been voted as a bonus to the employees of the Memphis Street Railway. The money represents an increase of \$1.76 an hour for each man.

Important Questions Answered.—“The Inside Track,” published by the Market Street Railway, San Francisco, devotes a page each month to the solution of perplexing problems that may come up in the course of the day's work. The December issue contains the question: What are the three most important factors which a motorman should consider when operating an electric car? The answers given, arranged in the order of their importance, were: (1) Safety. (2) Comfort of passengers. (3) Maintenance of schedules.

Railway Research Work Encouraged.

—To encourage research study in the electric railway field among university students, the executive committee of the Wisconsin Utilities Association authorized an arrangement whereby a fellowship will be granted at the University of Wisconsin in electric railway research work. Under this plan the association pays \$500 each year to a senior student in engineering to work on some problem which will be selected by Professor Rood and representatives of the association, and the results presented at railway section meetings.

Extension of Time Allowed.—The local transportation committee of the City Council of Chicago has granted the Chicago, North Shore & Milwaukee Railroad a delay of three more weeks before acting upon the opinion recently delivered to the Council by the corporation counsel holding that the railroad is operating passenger, merchandise dispatch, express and freight service over the elevated lines in the city without legal rights. This matter was referred to at length in the *ELECTRIC RAILWAY JOURNAL* of Dec. 8, page 985.

Shows Utility Development Through Cinema.—During the 1923 State Fair the Oklahoma Utilities Association, gave a free cinema entertainment in the Liberal Arts Building in Oklahoma City. About 10,000 people saw the production,

receiving information on the development of the public utility field in recent years. Among the most popular films were the “Go-Getter,” illustrating the benefits of electrically operated labor-saving devices on the farm, and “King of the Rails,” showing the history of transportation from the beginning of human relations down to the electrically operated transcontinental railroad.

Seeks Ordinance.—A resolution has been adopted by the Milwaukee Public Safety Commission, urging the Common Council to pass an ordinance requiring buses to stop for passengers at street car safety zones where such safety zones have been designated.

Tests to Solve Engineering Problems.

—Power company officials from many points along the Mississippi River will be greatly aided in solving their engineering problems by the results of tests being made by University of Iowa engineers, in co-operation with the Mississippi River Power Company at Keokuk. When completed, the tests will reveal the exact flow of the stream and show its course and flow as far back as 1874. The tests are in charge of Prof. Floyd

A. Nagler, director of the university's hydraulic laboratory, and Alrion Davis, hydraulic engineer of the Keokuk company.

Discusses Future of Railroads.—F. H. Hardin, chief engineer of motive power and rolling stock of the New York Central Railroad, in expressing his views recently in an interview in the *New York Times* on the future of the railroads said that the complete electrification of all railroads seemed to lie in the distant future. It was his belief that under present conditions electric power was costly, but that the cost might be cut by the conversion of water power into electricity on a large scale. Following the electrification of railroads in the neighborhood of big cities, these units will gradually be extended until they unite in a general system. He looked to the time when trains would be controlled by automatic devices eliminating the human element. He said that radio promised to play an important part in railroading in the future. It might be used to keep the ends of long freight trains in touch with each other, thus increasing the efficiency of the service.

Foreign News

Sanitation in Turkey

The thick red curtains in the street cars of Constantinople, which have separated the seats occupied by Moslem women from the rest of the car, will be removed, according to the plans of the authorities. This is on the ground that the curtains are carriers of disease. Instead, the two front rows of seats in the car will be reserved for Moslem women. However, a Moslem woman traveling with her husband may sit elsewhere “provided she does not contravene the civil or religious laws.”

Bids for Swedish Locomotives Rejected

The Swedish State Railways at Stockholm has rejected all bids for electric locomotives for the line from Stockholm to Göteborg, the electrification of which is under way. Seven Swedish firms and six foreign firms submitted offers. The rejection was partly on account of too high prices and partly on account of inconvenient delivery terms. The cheapest offer was submitted by the Allgemeine Elektrizitäts Gesellschaft of Berlin and the Siemens-Schuckert concern, their price being 195,000 Swedish crowns per locomotive. New bids have been asked for.

Address of Union Internationale Tramways Changed.—The headquarters of the Union Internationale Tramways, de Chemins de Fer d'Intérêt Local et de Transports Publics Automobiles has been moved in Brussels,

Belgium, from 23 rue d'Arlon, to 15 Avenue de la Toison d'Or.

British Cars for Calcutta.—The English Electric Company, Ltd., Preston, England, is constructing sixty cars for the Calcutta Tramways. This accompanies a scheme of track extension.

American Rails for Glasgow.—A contract for tramway track special work amounting to £8,568 for the Glasgow, Scotland, tramways has been awarded to the United States Steel Products Company by the tramways committee of Glasgow Corporation. This was preferred to the lowest English tender of £9,794.

Street Congestion in Glasgow.—Traffic congestion in the streets still occupies the attention of the Town Council of Glasgow, Scotland. James Dalrymple, general manager of the tramways, in a report on the subject, regards tube or elevated railways impracticable. He recommends the erection of a bridge over the River Clyde at Oswald Street and another one across the river opposite St. Enoch Square.

Turbo-Generator for London Tramways.—London County Council has accepted a tender by Richardson, Westgarth & Company, Newcastle, at £77,467 for the supply of a turbo-alternator of 15,000 kw. capacity for the Greenwich tramway power station. The set will consist of a two-cylinder turbine and condensing plant, with a Parsons alternator. The lowest tender received was £55,769, from a Swiss firm. The reason for adopting the British tender was the low steam consumption.

Financial and Corporate

Key Route Plan Approved California Commission Sanctions Cut of \$20,000,000 in San Francisco- Oakland Capitalization

The proposed reorganization of the San Francisco-Oakland Terminal Railways, known as the Key Route properties, held under foreclosure and sale in the hands of John S. Drum, Warren Olney, W. I. Brobeck and Hugh Goodfellow, and their associates, with a newly written total capitalization of \$28,277,500, has been authorized by the State Railroad Commission. The old capitalization was \$48,879,000.

The commission recognizes the unassailable validity of the foreclosure sale, and gives no force to the contentions of the holders of \$15,000,000 common stock as presented by Attorney Joseph E. Bien. It leaves open all questions of appraisal for rate-making purposes, and does not rule against the contentions of City Attorney Gray of Oakland in that matter.

The Key Route Transit Company, with a capitalization of \$17,750,000 under the approved reorganization, will have complete financial and operative control. Three subsidiary companies receive recognition. These are: Key Route Securities Company, capital stock \$2,600,000; East Oakland Railway, capital stock \$250,000, and Oakland & Hayward Railway, capital stock \$250,000.

As indicated in an article dealing with the proposed plan in the issue of the *ELECTRIC RAILWAY JOURNAL* for Sept. 15, page 424, the actual capital is distributed as follows: First mortgage bonds, \$2,500,000; refunding bonds, \$9,416,000; preferred stock, \$12,829,000; common stock (issued pro rata to holders of preferred), \$3,262,500; common stock to holders of "Dividend Note," \$250,000; East Oakland Railway, \$10,000, and Oakland & Hayward Railway, \$10,000.

The commission ruled that all the reorganization expenses reaching back for a period of many months and totaling \$500,000 must be paid out of earned moneys available for interest charges and for dividends, and must not be made a capital charge which (through fixing of rates, etc.) would rest ultimately upon the public.

The commission set forth as its principal reason for approval of the reorganization plan the "fact of necessity" and the state of finances of the old company, which had at the beginning of this year no funds with which to meet these four large obligations: Matured notes, \$3,200,000; funded debt due, \$1,357,000; matured interest \$2,706,585 and sinking fund installments due, \$2,919,000.

The decision in the Key Route case, brings to a successful culmination the

efforts of the past ten years to reorganize and restore these properties to financial stability. It sustains and upholds in every particular the plan of reorganization.

The company defaulted in its bond interest as long ago as 1913. These defaults were occasioned by the over-expansion of its transportation facilities subsequent to the fire of 1906 and the high cost of labor and materials. Spasmodic and unsuccessful efforts have previously been made to rehabilitate the company, but it was not until 1919—when the present committee entered on its duties, that real and substantial progress was made. This committee was finally able this year to bring all the interests into harmony and perfect a plan.

The intricacy of the readjustment negotiations is indicated by the fact that it was necessary to satisfy fifteen sets of security holders, each with a different interest to serve, with conflicting rights and with total investments in excess of \$20,000,000. By compromise and readjustment, the fifteen groups were brought to subscribe to the plan with practical unanimity.

At the last moment, however, when the plan was presented, as the law requires, to the Railroad Commission for its approval, a small stockholding interest attempted to block the carrying into effect of the plan. The ruling of the commission sustains completely the work of the reorganization committee.

This plan was the result of the labors of a committee, of which John S. Drum is chairman, and with whom is associated Herbert Fleishhacker, P. E. Bowles, W. W. Garthwaite, Benjamin H. Dibblee, Gavin McNab, A. Crawford Greene, Paul A. Sinsheimer, J. F. Carlston and George Tournay as members. They were assisted by sub-committees representing particular bond issues, of which advisory committees the chairmen were Warren Olney, Jr., L. A. Redman, Robert G. Hooker and Grayson Dutton.

Potomac Merger Approved

The proposed merger of the Potomac Public Service Company with the Potomac Edison Company, Frederick, Md., has been approved by the board of directors of the former company. As was announced previously in the *ELECTRIC RAILWAY JOURNAL*, this consolidation was expected.

According to indications Emory L. Coblentz, Frederick, former president of the Potomac Public Service Company, successor to the Hagerstown & Frederick Railway, who is now chairman of the board of directors of the former company, will hold the same position in the merged companies. M. F. Riley, president of the Potomac Public Service

Company, will be made president of the merged companies, it is understood, and Charles Harris, Henry Holzapfel and Walter S. Finlay, Jr., will be vice-presidents. The other officers, it is said, will be: Raymond E. Town, treasurer; Byron A. Winebrenner and Phillip L. Roth, assistant treasurers; Charles C. Waters, secretary, and Raymond E. Town and William K. Dunbar, assistant secretaries.

The capitalization of the combined companies will approximate \$22,000,000, according to Mr. Coblentz.

Columbus Case to Be Appealed

United States Supreme Court to Be
Asked to Pass Upon Decision
in Stockholder Suit

E. W. Clark & Company, Philadelphia, plans to appeal to the United States Supreme Court from the decision of the Ohio Supreme Court, rendered on Dec. 11, in which the Ohio court refused to hear the appeal of the Clark interests in the case of the Columbus Railway, Power & Light Company against the Clarks as former managers of the utility. It is understood that if the Ohio Supreme Court had consented to consider the appeal for a rehearing the Clarks would have insisted that there was unjust discrimination against them and in favor of local men, and that this denied the Clarks equal protection of the laws. It is on this ground that they now propose to take the case to the United States Supreme Court.

The litigation had its inception in a suit commenced by a stockholder against the directors of the company, including C. M. Clark. E. W. Clark & Company was also joined as defendant. All the defendants were charged jointly with liability upon the several claims presented on behalf of the company, but the Ohio courts released all of the other defendants, residents of Ohio, and held the Clarks alone liable, thus discriminating, the Clarks believe, in favor of local defendants and against non-resident defendants. The contention of the Clarks is that the judgment against them is about five times as large as the amount they received from the company for services rendered to it, and that these services fully justified the payments received.

The position of the Clarks throughout the litigation has been that in their relations with the Columbus company they never took any step that was not fully authorized by the board of directors, most of whom were local people with large holdings of stock and in no way affiliated with the Clarks, and that if there was anything wrong in any action or omission in connection with the business of the company, the responsibility rested upon the directors and not upon the Clarks. The Clarks also maintain that if they are liable the directors are equally, if not primarily, liable.

Dividends Paid in Stock

Earnings on Common of New Orleans Company to Be Put Back Into Additions to Property

A dividend of 8 per cent on the \$8,100,000 of common stock of the Public Service, Inc., New Orleans, for the year ended Sept. 30, 1923, has been declared by the directors of the corporation. This sum, amounting to \$648,000, will be returned to the company's treasury and the stockholders of the corporation will be given paid in stock in lieu of cash. With the issuance of the dividends in the form of stock, the common stock of the corporation will be increased to \$8,748,000, to be further increased next year, should the company continue to prosper, and a similar dividend be declared hereafter.

According to the agreement reached between the city of New Orleans and the Public Service, Inc., the issuance of paid in common stock must continue for a period of five years before the holders of common stock in the company will be paid cash dividends. They will then, under this plan of procedure, have increased their stock holdings approximately 40 per cent.

In making announcement of the dividend on the common stock, R. S. Hecht, chairman of the board, said:

While the company did not earn its full 7 1/2 per cent return on the rate base to which it is entitled under the settlement ordinance, it did earn a substantial margin over and above the amount required for this dividend. However, the stockholders will not receive the dividend in cash, because under the agreement with the city they are compelled immediately to reinvest the whole amount in the purchase of common stock of the company at par, and the same course must be followed in future years until dividends aggregating 40 per cent have thus been put back into the property.

The board of directors also authorized the increase of the common stock in an amount equivalent to the dividend, so that, as a matter of fact, not a dollar of capital is taken out of the assets of the company by the declaration of the dividend.

The company is in a healthy financial condition, but it emerged from the reorganization with a somewhat unbalanced set-up in that it has a total bonded debt of \$42,000,000, whereas the total amount of preferred and common stock outstanding is only \$12,000,000, which has always been considered by investment bankers as too small a margin behind the bonds.

The directors believe the present and prospective heavy requirements for new

capital can ultimately be met only through the sale from time to time of substantially large amounts of common stock which, by furnishing a proper margin of safety, will in turn permit the sale of additional bonds on a more advantageous basis. As the law of Louisiana requires stock to be sold at par, and as the common stock of the company is and has been selling considerably below par, this program prevents certain practical difficulties, for which, however, it is hoped that some solution can be found in the near future.

The budget and financial program of the company for 1924 have not yet been determined. The board of directors will decide at its January meeting the method which must be adopted to raise the large additional capital required for improvements and extensions in the coming year.

Brooklyn Surface Lines Out of Receivership

At midnight on Dec. 21 the property of the Brooklyn, Queens County & Suburban Railroad passed out of the control of Lindley M. Garrison as receiver and into the control of the company. A decree ordering the transfer was signed a few hours before by Federal Judge Mayer. The company operates surface lines on Reid, Sumner, Metropolitan and Utica Avenues, and on Broadway along with what is known as the Broadway Ferry shuttle.

The lifting of this company out of receivership leaves only two, the Brooklyn Heights and the Coney Island & Brooklyn Railroad Companies still in receivership, but it is expected that they will soon be returned to their owners.

Under the reorganization plan the stockholders of the company are expected to contribute toward meeting the company's liabilities in case the income is not sufficient to meet all of the needs. The receiver has on hand \$700,000 in cash and securities, but most of this will be needed by the company as working capital.

The liabilities on July 1 last consisted of defaulted interest on bonds held by the public, claims of unsecured creditors and tort claims, totaling \$1,045,497, exclusive of \$400,000 of defaulted interest on the \$2,000,000 principal amount of first mortgage bonds.

Abandonment Modified

Reasons Stated for Putting Off the Shutting Down of Service on Ohio Line

The Public Utilities Commission of Ohio has issued a modified order authorizing the discontinuance of service and abandonment of facilities by the West End Traction Company, a subsidiary of the Pennsylvania-Ohio Electric Company, Youngstown, at midnight on Feb. 1.

The original order of the commission issued on Dec. 14 had set midnight, Jan. 1, for the end of service on approximately 24 miles of track connecting Youngstown with Girard, Niles, Warren, Mineral Ridge and Leavittsburg, all in Trumbull County, Ohio, west of Youngstown.

The delay in the abandonment was granted by the commission upon petition of the city solicitors of Warren, Niles and Girard and the Trumbull County Commission. The petition followed a meeting of representatives of the governing bodies and civic associations of the committees affected called by the county commissioners when the original order of the Utilities Commission made it plain that street railway and interurban service would cease with the New Year.

The petition asking for delay recited that "the general welfare of the citizens" and "the future growth" of the municipalities would be affected seriously by the abandonment; that "the political subdivisions located along the lines of said railway are now negotiating in good faith and are desirous of continuing to negotiate toward a fare adjustment on the lines affected that will enable the company to continue the operation of its lines."

The company consented to the modification of the abandonment order upon the understanding that earnest efforts would be made by the communities so to adjust fares as to enable it to earn revenues sufficient at least to pay operating costs and taxes.

The crisis on the lines came on Oct. 6 when the application for abandonment was filed by the company. For

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population.

Street Railway Materials index is relative average price of

materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen and conductors on 105 street and interurban railways in the United States, operating more than 100 passenger cars each, and weighted according to number of cars.

some months prior the company had endeavored to secure a fare adjustment, but the definite refusal of the city of Niles to entertain any such remedy for the company's losses in the last four years brought about a situation where the company had no recourse excepting abandonment.

Following the order for abandonment, however, manufacturing and commercial interests of Niles were aroused. At the meeting of representatives of the various communities it was declared that Niles would join the other cities in seeking an arrangement whereby the operation of the lines could be continued. With this declaration the company consented to a month's delay. The negotiations will be conducted by the new city administrations taking office Jan. 1 in all the affected communities.

The present rates of fare are 10 cents cash for zones of approximately 5 miles; fourteen tickets for \$1 and 5 cents cash within municipal limits. The rate of fare suggested to permit the lines to continue are 15 cents cash for existing interurban zones; ten tickets for \$1; 10 cents cash within municipal limits, with eight tickets for 50 cents.

Commission Approves Sale of Point Pleasant Company

The Board of Public Utility Commissioners of New Jersey has granted the application of the Point Pleasant Traction Company, Point Pleasant, N. J., to sell its property and surrender its franchise. The concern formerly operated a street railway in the boroughs of Point Pleasant and Bay Head, N. J., but it was discontinued in 1919. The company has taken up all its rails and has abandoned its service. The company asked the commission for permission to sell its real estate situated in the two boroughs and also for permission to dispose of all other assets and retire from business and surrender its charter, all of which it has the consent of its shareholders to do. The board found that there was no demand for the operation of the electric railway in and between the two towns to warrant the retention by the company of franchises.

Payment of Kansas City Claims Being Arranged

Kansas City, Mo., will receive \$82,207 from the Kansas City Railways as a back payment for street cleaning and in car license taxes on the intercity viaduct. This is the result of an order from Judge Kimbrough Stone of the Federal Court.

J. C. Petherbridge, assistant city counselor, made the application and argued in favor of payment of the claims. Attorneys for the receivers, bondholders, damage suit claimants and for the company discussed the application in Judge Stone's chambers of the Federal building on Dec. 3.

Another application granted was for the payment of about \$3,000 to holders

of special deferred security certificates issued at the time of the old reorganization of the company in connection with damage suits then pending. A month ago the court ordered about \$120,000 of the certificates to be paid. Payment will be made on the basis of 80 per cent of the principal and 80 per cent of the interest.

Mr. Petherbridge said the city was badly in need of money and that the payments would be used in defraying the expenses of the city hospitals.

Note Maturity a Problem

New Haven Railroad Seeks Legislation to Deal with Issue of Trolley Holding Corporation

The New York, New Haven & Hartford Railroad has petitioned the Massachusetts General Court for legislation enabling it to acquire property of the New England Investment & Security Company, or such other legislation pertaining to the road's interest in that company as may be deemed necessary. The railroad directs attention to an interesting situation involving certain electric railways in which it is interested. Broad legislative authority is sought to enable the New Haven to deal with a situation which will arise next year, when \$13,115,000 notes of the New England Investment & Security Company come due April 1. All of these notes are owned by the New Haven.

The New England Investment & Security Company is a voluntary association, organized in 1906 by New Haven interests to acquire shares or other securities of electric railway or power companies. It controls through ownership, directly or indirectly, all or a majority of the stocks of the Milford, Attleboro & Woonsocket Street Railway, Springfield Street Railway and Worcester Consolidated Street Railway. The company also holds by assignment dated April 1, 1909, all the interest of the Worcester Consolidated Street Railway in the capital stock of the Worcester & Webster Street Railway and Webster & Dudley Street Railway.

In addition to notes, the New England Investment & Security Company has outstanding \$112,100 of 4 per cent cumulative preferred stock and \$100,000 common. There was formerly \$4,000,000 preferred outstanding upon which New Haven guaranteed the dividends, but practically all of it has been exchanged for first preferred stock of the Worcester Consolidated, thereby relieving the New Haven of its guaranty to that extent.

The notes which the New Haven owns were intended to bear interest at the rate of 3 per cent from date of issue, 4 per cent for the next five years and 5 per cent for the final five years. For several years no interest has been paid. Under the dissolution decree, the New Haven was supposed to dispose of its interest in the New England Investment & Security Company by April 1,

1919, but the date has been extended by the court from time to time.

It is explained that special legislation is necessary if the New Haven is to take over the properties for debt. On the other hand, the properties may be sold for the debt under the hammer.

Service Suspended in Monterey

The Monterey & Pacific Grove Railway, Monterey, Cal., discontinued service in Monterey on Dec. 5, because of the inability of its general manager to pay for its power bill. In spite of great difficulty, J. D. Brown, the local manager, has been sending out his cars for some time, even though the Public Service Commission threatened to close down on operations if he did not render payment to the power company.

The matter came to a head recently when the Coast Valley Gas & Electric Company sent a letter to Mr. Brown, telling him that further delivery of power would be discontinued if the company did not pay its bills before Dec. 1. In addition to this notice, the company also sent a communication to the City Council of Monterey informing it of the intention to close down on the power for the operation of the railway system.

Suspension in Monterey brings to an end one of the longest controversies in that section of the country. The difficulties of the company in its relations with the city of Pacific Grove were reviewed in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 17.

The local manager, J. D. Brown, following the suspension, announced that he had no plans for the immediate future. He said that having no money he could not afford to operate, and he would now await developments.

Auction Sales in New York

At the public auction rooms of A. H. Muller & Sons there were sold the following securities on Dec. 26:

\$5,000 Buffalo & Lake Erie Traction Company first and refunding mortgage 5 per cent bonds, 1936, twenty shares Buffalo & Lake Erie Traction Company common 11 per cent.
41 shares New York Railways, \$1 lot.
100 shares Brooklyn Rapid Transit Company, old stock, \$2 lot; 900 shares Brooklyn Rapid Transit Company common, old stock; 1,300 shares Brooklyn Rapid Transit Company common, old stock; certificates of deposit, \$1 lot.
\$50,000 Twenty-Third Street Railway refunding and improvement 5s, 50 per cent.
30 shares New York Railways, \$2 lot.
100 shares Interborough Metropolitan Company common v. t. c., \$5 lot.
100 shares Interborough Consolidated Company, preferred, \$8 lot.
\$3,500 North Carolina Public Service Company first mortgage, series "B," due April 1, 1934, 66½ per cent.
11 shares Michigan Electric Railway preferred "A," \$1 lot.
\$125 Michigan Electric Railway first and refunding mortgage "A" bond, due 1948, \$20 lot.

Will Discuss Extensions.—At the annual meeting of stockholders of the Buffalo & Lake Erie Traction Company, Inc., operating an interurban line between Buffalo, N. Y., and Erie, Pa., stockholders will consider proposed extensions of service in the vicinity of Erie, Pa.

\$25,100,259 Spent by Boston "L" in Five Years—\$10,000,000 More for 1924 and 1925

In a petition filed with the Secretary of State of Massachusetts asking legislative permission to issue bonds to an amount equal to the money paid in for stock of the West End Street Railway, which the Boston Elevated absorbed a year ago, the trustees of the Boston Elevated Railway filed a list of the total expenditures for capital purposes made since the creation of the Board of Trustees, as follows:

EXPENDITURES ON ROAD AND EQUIPMENT JULY 1, 1918, TO OCT. 21, 1923

Elevated structures and appurtenances	\$1,073,607
Surface lines	3,344,123
Carhouses and shops	3,072,742
Power houses and transmission of electricity	3,444,375
Cars	10,149,688
Miscellaneous	581,753
Total	\$21,666,289
Expenditures on road and equipment prior to July 1, 1918 for which capital had not been issued on that date	3,433,970
Total obligations for which the board of trustees has had to provide	\$25,100,259

The money with which to pay for these replacements and improvements has been obtained from the following sources:

Sale of Cambridge subway	\$7,868,000
Preferred stock	2,000,000
Bonds	1,986,000
Insurance and payments account real estate sold, about	1,500,000
Depreciation July 1, 1918-Oct. 1, 1923	10,521,000
Total	\$23,875,000

These amounts, it is explained, by no means cover the expenditures which should be made in order to place this transportation system in the condition necessary to give satisfactory and adequate service.

The accompanying table shows expenditures which are needed in order to provide for the proper development of this system. According to the company the items for cars are less than is desirable and should be increased as soon as practicable.

Of the \$9,208,032 estimated for the calendar years 1922 and 1923, \$8,555,608 has been authorized and approximately \$3,765,000 has been paid to date. This leaves approximately \$4,790,000 of the 1923 expenditures yet to be financed.

PROPOSED EXPENDITURES FOR ROAD AND EQUIPMENT

	1922	1923	1924	1925	Total
Everett shops	\$205,842	\$1,190,232	\$1,445,518	\$2,052,180	\$4,893,772
Track betterments	84,924	700,000	700,000	700,000	2,184,924
Surface carhouses—modernizing	40,715	500,000	500,000	500,000	1,540,713
Miscellaneous buses, machinery, etc.	35,127	300,000	300,000	300,000	935,127
Power—South Boston power station and conduits	397,314	1,450,000	800,000	1,400,000	4,047,314
Cars	1,715,220	1,710,000	1,000,000	800,000	5,225,220
George Street storehouse	160,000				160,000
Forest Hills signal system	124,010				124,010
Forest Hills extension	122,500				122,500
Neponset terminal	24,350				24,350
East Boston tunnel changes		47,800			47,800
Total	(a) \$2,910,000	\$6,298,032	\$4,745,518	\$5,752,180	\$19,705,730

(a) These are gross expenditures. Credits for property charged off, property destroyed by fire, property sold, etc., have been eliminated. (b) Appropriations carried over to 1923.

Approves Bond Purchase.—The State Railroad and Public Utilities Commission has approved the application of the Jackson Railway & Light Company for authority to issue \$55,000 of 5 per cent gold bonds. The proceeds of the sale will be used to purchase new equipment deemed necessary for the system in Jackson, Tenn.

Extra Dividend on Illinois Traction Common.—The Illinois Traction Company, Peoria, Ill., has declared an extra dividend of \$1.50 on the common stock payable on Jan. 2 to stock of record Dec. 20. The last regular dividend of the Illinois Traction on the outstanding common stock was 50 cents a share declared payable on Oct. 1 for the previous quarter. The stock is of \$50 par.

Abandonment Allowed.—The Corporation Commission of Virginia granted the petition of the Virginia Railway & Power Company to abandon lines on County Street in Portsmouth. The appeal was favorably received on the grounds that the High Street line parallels it and jitney competition is too keen for its existence, as the jitanies operate on a 5-cent fare, against 6 cents charged by the company.

Abandonment Petition Deferred.—The hearing on the petition of the International Railway for permission to abandon part of its line in the city of Niagara Falls, scheduled for Dec. 17 in Buffalo, was postponed by the commission to a date to be announced after Jan. 1. Corporation Counsel Robert J. Moore of Niagara Falls asked for postponement because of pressing municipal matters.

Gold Notes Offered.—Dillon, Read & Company, New York, are offering at 99½ and accrued interest, yielding about 6.40 per cent, \$3,500,000 of the Philadelphia Rapid Transit Company's two-year 6 per cent secured gold notes. The notes are dated Dec. 1, 1923, and are due Dec. 1, 1925. The notes will be secured by deposit with the trustee of \$4,667,000 Philadelphia Rapid Transit Company fifty-year 5 per cent sinking fund gold bonds, due March 1, 1962, the bonds thus being pledged at 75 per cent of their face value. The fifty-year 5 per cent gold bonds, due March 1, 1962, are a direct obligation of the Philadelphia Rapid Transit Company, specifically secured by a first lien on all of the capital stock and the leasehold of the Market Street Elevated Passenger Railway. In addition, payment of

the principal and interest of these bonds is guaranteed by the Union Traction Company of Philadelphia.

Sale of Certificates Approved.—The Public Utilities Commission has approved the petition of the Memphis Street Railway, Memphis, Tenn., for permission to issue \$344,000 in car trust certificates. The funds secured by the sale of the certificates, together with a \$160,000 cash payment, is the purchase price of forty new double-truck cars which will be placed in service at an early date. The specifications of these cars were given in the ELECTRIC RAILWAY JOURNAL, issue of June 2. The certificates will become due and payable in annual installments of \$35,000 beginning Dec. 1, 1924.

Sale Declared Legal.—Sale of common stock of the Chicago Elevated Railroad collateral trust, which controls the elevated lines, was recently declared legal by the Illinois Appellate Court. The stock in 1914 was pledged as collateral for a \$14,000,000 gold note issue of the trust. The court reversed an order of Circuit Judge Hugo M. Friend. That judge enjoined the proposed sale on the petition of two holders of preferred stock. Those plaintiffs alleged the sale would be the first step in "a conspiracy to place the elevated roads under the control of Samuel Insull and the Commonwealth Edison Company." In view of the decision it is believed immediate steps will be taken to effect the sale, which had been set for Oct. 3 in New York and was stopped by temporary injunction.

Payment of Dividend Rental Deferred.—At a special meeting of the board of directors of the Interborough Rapid Transit Company, New York, N. Y., on Dec. 14 it was determined that payment of the installment of the Manhattan Railway quarterly dividend rental due Jan. 1, 1924, to Manhattan Railway stockholders participating in the plan of readjustment should be deferred. Under the plan, the Manhattan dividend rental at the rate specified in the agreement (4 per cent for the current year) is cumulative, and must be met in full before any dividends can be paid on Interborough stock.

Settlement of Lease Problem Postponed.—Official announcement has been made that it may be found desirable to postpone the question of the lease of the West Jersey & Seashore Railroad, operating steam and electric service from Camden to Atlantic City, to the Pennsylvania Railroad until the future. The Pennsylvania already owns a controlling interest in the West Jersey company. Some minority holders of West Jersey favored a rental, which would provide for a straight 6 per cent dividend, while others favored the capitalization of some part of the surplus through declaration of a stock dividend in such way as would provide a return of not less than 6 per cent on present holdings. The Pennsylvania is reported to have favored a 5 per cent return.

Traffic and Transportation

Fares Cut in Des Moines

New Rate of Seven Cents Put Into Effect Because Stabilizing Fund Has Reached \$150,000

The Des Moines, Iowa, City Railway surprised its patrons at Christmas with the announcement of a reduction in fares from 8 cents to 7 cents. The fare cut was actually announced on Dec. 22. On account of the franchise provision, which requires that five days' notice be given to the City Council of any change in fare, the new rate becomes effective on Dec. 27. The decrease really has come about as a result of the stabilizing fund reaching the \$150,000 mark.

As a matter of fact, when the company's books were closed for the month of November the so-called cushion fund, provided under the franchise adopted in November, 1921, had reached \$150,902 and immediately upon closing the books F. C. Chambers, president, hastened to keep faith with the public by announcing the reduction. Mr. Chambers gives credit for arriving at the goal to the co-operation of the public and the efficiency of the railway employees. He calls attention to the fact that the reduction is in excess of 12½ per cent, which is noteworthy in the case of a business operating upon such a narrow margin.

Further evidence of the company's desire to keep faith with the public is shown by the fact that coincident with the 7-cent fare becoming effective to city car riders, it will also become operative on the three lines which run outside of the city limits. Since the adoption of the new franchise patrons on the Valley Junction, Fort Des Moines and Urbandale lines have paid an additional 2 cents upon reaching the city limits. In the future 7 cents will cover one complete ride from Des Moines to the end of any of these lines.

In this connection it is also interesting to note that while the franchise entitled the company to charge 16 cents for fares on owl cars and 4 cents for school children, these provisions have never been exacted and the fare on owl cars has been 10 cents and that for school children 2½ cents.

The fare reduction is also more noteworthy when it is considered that during the past eighteen months the company has made very heavy expenditures for reconstruction and has practically completed the new Crocker Street line.

According to the terms of the franchise, if the stabilizing fund should be decreased to \$100,000, the fare will revert to 8 cents, but Mr. Chambers has said that every effort will be made by his company and its employees to prevent such a contingency.

At the very time the fare reduction was announced a hearing was being

held in the Polk County District Court upon the suit brought by Grant Van Horn for the North Des Moines Improvement League to test the reasonableness of the 8-cent fare provided in the franchise. Van Horn originally attempted to revoke the franchise on the score that it was invalid, but upon losing this case he amended his petition so as to confine his attack to the question of the reasonableness of the fare.

Efforts made by the company since the adoption of the franchise have been so sincere and have produced such improvements in service that the average citizen of Des Moines is taking no interest in the Van Horn case, being satisfied that the franchise is a good bargain.

Jitneys Prohibited in Gadsden

Jitneys have practically been legislated out of Gadsden, Ala. On Dec. 17 the City Council of Gadsden adopted a city ordinance prohibiting the operation of jitneys on streets where street cars of the Alabama Power Company operate. This puts the jitney out of business in Gadsden's downtown section. This ordinance was referred to in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 17.

The city ordinance also prohibits the operation of jitneys from Gadsden to Alabama City and Attalla, both connected with Gadsden by electric railway. For some time past numerous jitneys have operated between Gadsden and these two towns. Taxicabs are excepted in the ordinance.

The jitney owners' association of Gadsden threatens to contest the ordinance in the courts.

New Crosstown Service in Indianapolis

Crosstown service in Washington Street, Indianapolis, became a reality on Dec. 16. At intervals from four to eight minutes throughout the day cars of the Indianapolis Street Railway will be run between Irvington and Mount Jackson, straight across Washington Street. All the cars now on the West Washington Street line will make the crosstown run, while several of those now on the East Washington line will make the entire trip. Four-minute service will be given on the crosstown line in the rush hours and from six to eight-minute service at other periods of the day.

The cars on the East Michigan Street and Brightwood lines will be rerouted downtown as a result of the establishment of the crosstown line. A plan of running two cars an hour between Irvington and Mount Jackson was tried by the company last year, but it did not prove a success.

Fare Plea Makes Progress

Council at Atlanta Appoints Committee to Inquire Into Appeal for Ten-Cent Fare

Progress is being made by the Georgia Railway & Power Company, Atlanta, Ga., in connection with its appeal for a 10-cent cash fare and the right to charge 2 cents for a transfer. The Council has appointed a committee, with Councilman Bachman at its head, to audit the company's books, investigate the statements made by the company and call a public hearing on the question.

Following this public hearing the committee will recommend to the council whether or not the petition should be granted in whole or in part. If the report is favorable, the case will be taken up with the Public Utilities Commission of the State. Several months may intervene before the matter is finally settled.

There are several features of the matter that have new angles. In the first place the company has realized the necessity for stating its case to the public fully and frankly. To this end it has opened its books to the public, told the facts in the case, and appealed for a chance to make a fair return on its earnings. In this connection it should be borne in mind that the company is seeking a return of 8 per cent on the money invested so as to establish its earning capacity and permit it to increase its borrowing power. This, in turn, will enable it to secure funds to add new track and equipment and improve its service.

Beginning several months ago the company started putting placards in its cars to show how much money it spent on the various items connected with the railway. Starting with the 7-cent fare, it showed each week how much of that 7 cents went to pay for supplies, for new equipment, for salaries, for repairs and for other purposes. At the end of this series of posters, the fraction of a cent the company actually lost was graphically shown.

The attention of the public was next turned to transfers. The company showed—still by the poster method—how each transfer was issued at a loss of more than 2 cents. It showed why the transfer system was an unfair burden.

From transfers, the advertising was turned to the increase in the cost of maintenance. Item by item, the company showed how the cost had risen in the past five years 100 or 150 or 200 per cent as the case might be. This established the increase in the cost of operation in the public mind beyond a doubt.

Next came a series of total figures—showing the great cost of maintenance and the volume of material needed just to keep the railway in operation without providing new track and new equipment.

Finally the company presented its petition to the City Council. Simul-

taneously, in every car in the city, there went up this placard.

"What will you do with your street railway?"

That is the appeal the Georgia Railway & Power Company has made all the way through on this campaign—the slogan under which it will fight for 10-cent fares and an 8 per cent return on its invested capital. It is an open invitation to the public to help the company solve its problems. In its petition the company said in effect:

We have studied this thing from every angle—and we do not see any other way out of it.

We must get more money—make a larger return in our investment—or we are stopped. We have already borrowed all the money we can. The state will not permit us to issue any more bonds.

Either we must increase our income through an increase in fares—or quit.

But if you, Mr. Commuter and Business Man, know any better method of getting around the situation—sit down and let us know about it.

We need your help.

Immediately after the request was printed, letters began to come into the office of the company. Some were good, some bad, some indifferent. All of them indicated an interest on the part of the public, and many of them expressed a desire to help the company out of its difficulties. In a way, this was the most remarkable feature of the entire campaign.

The petition could have been taken to the Public Utilities Commission direct, but the company desired to explain the matter in advance to the public and thus to win its support by the soundness of its claims.

1,928 Los Angeles Trainmen Receive \$90,000 Bonus

The fourth annual Christmas bonus was paid by the Los Angeles Railway to 1,928 trainmen, in checks ranging from \$5 to \$160 and totaling \$90,000. The regular bonus is \$60 a year, on a basis of \$5 a month. Trainmen come under the bonus system when they have been in service six months. They start with an efficiency record card of 100 per cent and credits and demerits are assessed under the company's merit system, which was described in the *ELECTRIC RAILWAY JOURNAL*, issue of April 28, 1923, page 721.

For every month that a trainman's record is 100 per cent or better he is credited with a \$5 bonus. The ten top motormen and conductors of each division and the ten top men of the safety car list were selected for special prizes running from \$10 to \$100 in addition to the regular bonus. In selecting these men, officials of the company were governed to a considerable extent by the general attitude and appearance of trainmen as well as by the figures of their record.

Two changes have been announced in the administration of the merit and bonus system for 1924. Demerits for which a trainman might lose some of his bonus will be canceled providing the offense is not repeated in three months. This is intended to make the system more corrective and less dis-

ciplinary. The second change is that the special awards which go to 110 men will be in even amounts. The company budget for the year assumes that every trainman participating in the bonus will receive the full amount for the time he has served. Money remaining due to some trainman not receiving full bonus will be divided evenly among the 110 men whether it amounts to \$5 or \$100 extra.

Saginaw Makes Good Showing

The Saginaw Transit Company, Saginaw, Mich., reported gross earnings for November of \$29,646, with net after taxes of \$6,044, to meet monthly interest requirements of \$2,475. The company carried 465,000 passengers during November. When partial railway service was resumed in Saginaw on Nov. 1 the city had been without railway accommodations for two years. It was not until Dec. 1 that the full measure of service was restored, there.

Working Out Bus Plan in Spartanburg

While the South Carolina Gas & Electric Company, Spartanburg, S. C., is awaiting a decision of the Supreme Court on the petition of the city to make the company renew operation of its cars or forfeit its franchise the City Council and George B. Tripp, president of the company, are getting together and working out a satisfactory system of handling the buses. At a recent conference which was the outgrowth of complaints made to the City Council that buses were stopping in the middle of the city blocks to take on and discharge passengers, Mr. Tripp suggested to the Council that a space of 50 ft. should be set aside on the blocks where the buses must stop to receive and unload passengers. No automobiles would be allowed to park in these areas. Mr. Tripp will prepare a map containing his ideas with reference to handling traffic for the buses and this will be later submitted to the City Council.

Commission Hears Ten-Cent Fare Petition of Kingston Company

A hearing was held before the Public Service Commission on Dec. 11 in the matter of the petition of the Kingston Consolidated Railroad for permission to charge an 8-cent ticket and a 10-cent cash fare in lieu of the 7-cent fare now charged in Kingston, N. Y. Howard Chipp, attorney, and G. B. te Bow, general manager, represented the company.

Mr. te Bow testified as to revenues and expenses covering operations of the Kingston road for several years. He said the operating revenues for the first seven months in 1923 were \$169,588. The operating expenses for the same period were \$129,026 and the taxes paid by the company amounted to \$11,367. Another hearing will be held on Jan. 8.

Los Angeles Urged to Hire Traffic Expert

The Los Angeles Traffic Commission recommended on Dec. 18 to the Los Angeles City Council and the Board of Supervisors of Los Angeles County that a transportation expert be employed with a view to working out a plan for rapid transit both within the city of Los Angeles and to all outlying points. It is reported that Major R. F. Kelker, Jr., Chicago transportation expert, who prepared the plans for the Chicago rapid transit system, would be recommended to work out the proposed Los Angeles metropolitan railway system. The plans of the traffic commission involve the construction of elevated lines, subways and open cuts. One of the difficulties encountered by expert engineers in the past in studying the transit situation in Los Angeles is the lack of existing loop lines and the comparatively few crosstown lines.

The traffic commission outlines in its resolution to the City Council and county officials that it was prompted in making the recommendation for a proposed transportation survey because of the "ever increasing and harassing congestion" in the city, and that for that reason there is a need "for a thorough survey of the entire problem of public transportation in the metropolitan area of Los Angeles."

P.R.T. Plans Ordinances for Bus Development

The Philadelphia Rapid Transit Company plans the early introduction of enabling ordinances for consideration of the incoming city administration in order to meet the growing demand, through the newspapers and otherwise, for a bus line on Broad Street. This service as proposed will provide increased carrying capacity into and out of the delivery district. The universal fare will be 10 cents. Passengers originating at or destined to points away from motor bus lines will continue to use the 3-cent exchange ticket privilege between buses and connecting street cars to complete their ride. Transfers between buses cannot be given, because each passenger is to be supplied with a seat, which serves to limit the maximum carrying capacity of the buses.

Three-Cent Fare for School Children.

—Half fare for Oakland school children or a rate of 3 cents went into effect on Dec. 10. The San Francisco-Oakland Terminal Railways placed books of tickets on sale which will not be accepted on Sundays, Saturdays, holidays or during periods of vacation. They will be honored only during such hours as school attendants use the company's service. This is in accordance with the ruling of the State Railroad Commission.

Must Come to Dead Stop.—The Public Service Commission has directed the Hudson Valley Railway to cause all of its cars to come to a full stop before crossing what is known as the Pratt's

crossing on the Waterville Mechanicville highway in Half Moon, Saratoga County, N. Y. In view of the heavy traffic over the trolley crossing and the frequency of trolley car movements the crossing is of such character as to make it dangerous. In addition the speed of cars has been restricted at the crossing, but the commission holds that as a further need to protect the traveling public all cars must come to a dead stop.

Rochester-Erie Freight Service.—Through freight service will be installed over the Rochester, Lockport & Buffalo Railroad and Buffalo & Lake Erie Traction Company from Rochester, N. Y., to Erie, Pa., according to an announcement at the Rochester, Lockport & Buffalo offices. The institution of this service will permit thirty-six-hour delivery between the two cities and will eliminate trucking charges in Buffalo, through the two companies using the same freight station in Buffalo. The Rochester, Lockport & Buffalo also has opened half-hour passenger service between Rochester and Brockport during eleven hours of the day. It was planned to start the new service on Dec. 29.

Railway Wins Injunction.—An injunction obtained several months ago by the Kansas City Railways, Kansas City, Mo., against the enforcement of an ordinance specifying changes in street car stops at Thirty-first and Main Streets was made permanent Dec. 19 by Judge Stone in the United States Circuit Court. The ordinance came as a result of a protest made by property owners on the north side of Thirty-first Street, who maintained that their business suffered because the cars stopped at a point distant from their stores. The railways held that the stopping of the cars before crossing Thirty-first Street would delay the traffic. According to the ruling of Judge Stone the cars will continue to stop at the present designations.

Parked Automobiles Tagged.—In connection with the recent safety campaign conducted by the motormen and conductors of the Lehigh Valley Transit Company, Allentown, Pa., the members of the Safety Committee went out and tagged all parked automobiles on the Saturday afternoon and evening before Christmas in the various cities and towns along the line with a ticket which is a facsimile of the Police Department tag. One side of the tag shows three automobiles with safety signals for drivers, namely, "Turn to the Right, Stop and Turn to the Left." The other side said: "You are tagged for safety by the General Safety Committee, Transportation Department, Lehigh Valley Transit Company." The tag gave statistics on the number of people killed by automobiles in the United States and asked for the co-operation of the tagged one in stopping accidents. The safety campaign of this company, referred to previously in these pages, was entered into very enthusiastically by the employees and patrons.

Personal Items

Mr. Livers Resigns

Achieved Success with Charlottesville & Albemarle Railway—Active in Local Improvement Projects

John L. Livers has resigned as president of the Charlottesville & Albemarle Railway, Charlottesville, Va., and vice-president of the Virginia Western Power Company, with which the railway and light properties were recently merged. The first week in January he will leave with his family for Florida, and intimates that he plans to pay a long intended visit to Cuba and possibly Mexico. It is understood that Mr. Livers will continue to make Charlottesville his home during the summer and will keep up his interest in the suburban development of the community notwithstanding. He is president and the principal stockholder in the Redland Land Corporation, which is developing the Jefferson Park and the Meadow Brook additions at Charlottesville.

"Johnny" Livers, as Mr. Livers is familiarly known, took over the Charlottesville properties as manager in 1912. Later he was made vice-president as well as manager, and in 1921 he was elected president. He completely rehabilitated the utility properties there and placed them on a dividend paying basis. This was certainly no inconsiderable job, but in carrying it through Mr. Livers resorted to many new and novel ideas. He was quick to realize the value of consumer co-operation, but this is difficult to achieve even in a small community. As a result of his efforts Charlottesville, a city of 7,000 population, has a five minute headway the year round, and a 5-cent fare. Not only this but Mr. Livers has been conspicuous for his uniform and cordial support of every project that would make for the improvement of local conditions and the industrial and civic betterment of the whole section.

The extent to which he endeared himself to the entire community is attested by the editorial "A Model of Civic Conduct," published by the Charlottesville *Daily Progress* in its issue of Dec. 22. In the course of a column editorial expressing its regret at his loss to the community that paper said:

The most conspicuous trait of Mr. Livers was a remarkable modesty that amounted nearly to self-effacement. He was everything for the cause he had to serve, or object to attain, but next to nothing for himself. And he was indifferent in this way as to his own recognition, without being in the least shrinking or diffident in pushing the cause or interest in which he had faith. He was, however, essentially a man of achievement and vision that amounted to genius, and this community will long miss his far-seeing and sympathetic mind in its future counsels, and wonderful talent for overcoming difficulties in execution.

Mr. Livers was born in Gettysburg, Pa., in 1878. Starting as a lineman at the age of eighteen he worked for several years in various phases of con-

struction work. He then entered the operating and contracting field, and during a period of twelve years constructed more than 100 electric light and power plants. As stated previously he took charge of the Charlottesville property in 1912.

John Kelly has replaced John A. Roach as roadmaster of the East St. Louis Railway, East St. Louis, Ill.

Floyd E. Harper has succeeded H. B. Hurd as secretary of the Dubuque Electric Company. C. B. Zeigler has replaced J. N. McCallum as treasurer.

Harry T. Edgar has assumed the presidency of the Paducah Electric Company, Paducah, Ky. He is also president of the Keokuk Electric Company, Keokuk, Iowa.

J. W. Muir has succeeded J. A. Shepherd as auditor and assistant treasurer of the Alabama Power Company with office in Birmingham.

S. W. Willers has succeeded E. Curtis as chief engineer of the power station of the Fort Smith Light & Traction Company, Fort Smith, Ark.

Charles Dunn has succeeded Hamilton Baluss as general manager of the Susquehanna Traction Company, Lock Haven, Pa.

F. A. Brown, who has been in charge of the statistical department of the Wisconsin-Minnesota Light & Power Company in Eau Claire for more than a year, has been transferred to the Northern States Power Company's office at Minneapolis as head of the company's statistical department.

William Mangold has completed twenty-five years' service with the United Railways & Electric Company, Baltimore. He has served in different capacities from clerk and stenographer until he became chief clerk under the present superintendent.

Scott S. Crane, general manager of the Altoona & Logan Valley Electric Railway, Altoona, Pa., has completed his twenty-eighth anniversary as general manager at Altoona. Mr. Crane entered the Logan Valley service in 1895 following three years in Altoona as a telegraph operator for the Pennsylvania Railroad.

Harry A. Brinkerhoff, consulting engineer, was recently elected the first city manager of Portland, Me., at the organization meeting of the new City Council. He has had large experience in handling important engineering projects in many parts of the United States and Canada. Until two years ago, when he established himself as a consulting engineer, he was for more than twenty years with Westinghouse, Church, Kerr & Company of New York. Mr. Brinkerhoff is a member of the

American Society of Mechanical Engineers.

John J. Kaskie, for several years associated with the claims and legal department of Mitten Management in the operation of the Philadelphia Rapid Transit Company, will become general attorney for the International Railway, Buffalo, Jan. 1, 1924, according to an announcement by Herbert G. Tulley, president of the International. Mr. Kaskie will have charge of all negligence claims and litigated cases. The appointment of Mr. Kaskie does not affect the status of Thomas Penney, who remains general counsel for the International Railway.

Charles H. Quinn, chief electrical engineer of the Norfolk & Western Railway, has resigned. His first railroad experience was on the Southern Pacific at San Antonio, Tex., where he entered the service as machinist's apprentice. In 1901 he went to the Norfolk & Western as a draftsman. One year later he was promoted to electrical foreman, which position he held for five years. In 1906 he was appointed assistant engineer of motive power. Nine years ago Mr. Quinn was promoted to chief electrical engineer of the road, which position he held up to the time of his resignation.

Obituary

Alfred Hare, railroad builder of Oklahoma, died recently in Oklahoma City. He was a prominent factor in the promotion and building of the interurban railway between the cities of Tecumseh and Shawnee.

J. W. Waggener, formerly secretary of the Atchison Railway, Light & Power Company, Atchison, Kan., died on Nov. 23, 1923. Mr. Waggener was general superintendent of the company from 1909 to 1922, at which time he became secretary and C. A. Leland, Jr., became general superintendent. Mr. Waggener belonged to one of the prominent families of Atchison. His death was a distinct loss to the general industrial life of the city.

Stephen C. Mason, president of the National Association of Manufacturers from 1918 to 1921, died recently at his home in Pittsburgh. Since 1896 he was secretary and director of the McConway & Torley Company and was widely known in the railroad field. At the age of nineteen he went to work on the Connecticut & Passumpsic Railroad. Eight years later he joined the Interstate Commerce Commission and here he was in charge of the compilation and publication of the commission's statistics of railways in the United States. He was a member of the National Industrial Conference Board, Pittsburgh Chamber of Commerce, the Railway Club of Pittsburgh and of other prominent associations. He was one of the leading advocates of the open shop as a solution of the labor problem.

Manufactures and the Markets

News of and for Manufacturers—Market and Trade Conditions
A Department Open to Railways and Manufacturers
for Discussion of Manufacturing and Sales Matters

Market for Second-Hand Safety Cars

Heavier Traffic Has Caused Substitution of Larger Cars and Safety Cars Are Available at a Low Price

A fairly good market for safety cars is reported by dealers in second-hand railway equipment. At the present time a street railway in one of the larger cities is replacing a number of its single-truck one-man safety cars by larger units. This is being done because the traffic on the line where these cars were formerly used has been built up to a point where the railway feels that cars of larger capacity are needed. As a result of the change there are available a number of one-man Birney cars at a comparatively low price. These cars have been operated for a short period of time only, and they have been well maintained. They are therefore in first class condition.

A considerable saving in first cost might be accomplished by the purchase of such cars. It is pointed out that the operating cost being much lower than that of a heavier double-truck car, railways could save money by the use of safety cars in the off-peak period. The fact that these cars can be purchased at such a reduced price might make it possible for the railway to make such an investment for use only during those hours. Hence, they might be used on a route where traffic was sufficiently heavy to demand two-man cars in the rush hours. Such a proceeding would scarcely be economical if the cars had to be purchased at the original cost at which they were obtained from the builders.

A number of railways have recently purchased second-hand safety cars. In one case this was done because it was desired to increase service slightly on lines where these cars were already in service. In another case they were bought for service on lines with very light traffic, and it was apparently the idea of the railway to purchase rolling stock as cheaply as possible.

The light weight of the safety car is a favorable factor where shipping charges are to be considered.

Railways Buying Auto Sweepers

In preparation for their annual snow-fighting campaign many railways have recently been buying automobile snow-sweeping equipment. The Fox Rotary Snow Broom Company reports that this apparatus is being used to augment the regular snow sweepers on many properties. In one case the railway uses the automobile sweeper to clean out wyes where the rail sweepers operate

with difficulty and which were formerly cleaned by hand labor. This apparatus has been found useful also for removing the ridge of snow left by the rail sweepers between the tracks. Another advantage claimed is that an auto sweeper is not tied up by other vehicles stalled on the tracks. They are useful also where storage battery cars are operated and the power is insufficient to climb a steep grade and at the same time operate the brooms.

Dividend to Be Paid in Stock

A plan for taking care of dividends accumulated on the preferred stock since 1913 has been proposed by a committee of stockholders of the Laconia Car Company. It provides for an increase of the present authorized common stock from 10,000 shares to 65,000 shares of no par. In lieu of accumulated dividends on preferred, 10,000 shares of the increased authorized common are to be given preferred stockholders, this to be made convertible into common on the basis of four and a half shares of common for each share of preferred, if converted prior to March 1, 1924, and four shares of common for each share of preferred thereafter.

Record Set by Wire Works

The weekly average production by the Chicago Works of the Western Electric Company during November was 565,795,000 ft. of conductor wire. The total production for the month was 2,263,180,000 ft. In four weeks the Chicago factory almost surpassed the best previous record for a five-week month. Output is stated in "conductor feet" because of the fact that different sizes of cable are made up of a different number of pairs of wire. The conductor foot is a term representing the amount of wire going into cable of all sizes and is a standard unit of measurement for purposes of comparison.

Metal, Coal and Material Prices

Metals—New York	Dec. 26, 1923
Copper, electrolytic, cents per lb.	13.00
Copper wire base, cents per lb.	15.625
Lead, cents per lb.	7.45
Zinc, cents per lb.	6.62
Tin, Straits, cents per lb.	47.25
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	\$4.67
Somerset mine run, Boston, net tons	2.125
Pittsburgh mine run, Pittsburgh, net tons	2.00
Franklin, Ill., screenings, Chicago, net tons	1.95
Central, Ill., screenings, Chicago, net tons	1.975
Kansas screenings, Kansas City, net tons	2.00
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	\$6.65
Weatherproof wire base, N. Y., cents per lb.	17.50
Cement, Chicago net prices, without bags	\$2.10
Linseed oil (5-bbl. lots), N. Y., per gal.	\$0.93
White lead, in oil (100-lb. keg), N. Y., cents per lb., carload lots	11.255
Turpentine, (bbl. lots), N. Y., per gal.	\$0.92

Paving Brick Shipments Remain High

Considering seasonal influences, shipments of vitrified paving brick for November were running above normal, according to a report just made by the National Paving Brick Manufacturers' Association. For the first time since last spring the total number of brick manufactured for the month ran greatly in excess of shipments, indicating that companies are manufacturing for stock in anticipation of late winter and early spring shipments.

Larger Motors Being Installed on Salt Lake City Cars

Installation of larger motors in the equipment used by the Salt Lake & Utah Railroad and the construction of new sidings for accommodating longer trains are now going forward on this line, involving an expenditure of \$50,000. The additional sidings are being placed at the towns of Bringhurst and Cutler.

With the installation of the larger motors, fifteen cars of freight can be hauled at one time and double this number of empty cars can be handled by the new locomotives. The electric locomotives will weigh 120,000 lb. and will be equipped with larger axles than the present equipment and also with journal boxes. The new equipment is expected to arrive in time to handle the heavy freight work of the early fall of 1924.

Railroad Tie Producers Will Meet

The sixth annual convention of the National Association of Railroad Tie Producers will be held in Kansas City, Mo., at the Hotel Muehlebach, on Jan. 17-18, 1924. Prominent speakers will discuss subjects of interest to cross-tie producers. A feature of the meeting will be round-table talks, in which the producers themselves will discuss their problems.

Rolling Stock

Des Moines City Railway is expecting to put ten new cars into service early in the new year. Twenty cars were ordered July 1, but there have been numerous delays and no promise of delivery has yet been secured for the second ten. The detailed specifications of the cars follow:

Builder of car body	
McGuire-Cummings Manufacturing Company	
Type of car	Semi-convertible motor passenger
Seating capacity	48
Weight	
Car body	20,000 lb.
Trucks	10,000 lb.
Equipment	8,000 lb.
Total	38,000 lb.
Bolster centers, length	20 ft. 6 in.
Length over all	46 ft. 0 in.
Truck wheelbase	5 ft. 6 in.
Width over all	8 ft. 2 in.
Body	All steel
Interior trim	Light cherry
Headlining	Agasote
Roof	Arch
Air brakes	General Electric
Armature bearings	Sleeve

Axles	Quenched and tempered
Bumpers	Channel
Car signal system	Faraday
Car trimmings	Polished bronze
Center and side bearings	Plain
Control	K 35-JJ
Couplers	Portable
Curtain fixtures	Curtain supply
Curtain material	Pantasote
Destination signs	Keystone
Door-operating mechanism	National Pneumatic
Fenders or wheelguards	H. B.
Gears and pinions	G. E. Grade M
Hand brakes	Peacock
Heater equipment	Consolidated electric
Headlights	Golden Glow
Journal bearings	Plain
Journal boxes	McGuire-Cummings
Lightning arresters	General Electric
Motors	Four G. E. 247-1
Motors	Outside hung
Paint, varnish or enamel	Vitrolite
Registers	International No. 5
Sanders	Des Moines City Railway type
Sash fixtures	Dayton Manufacturing Company
Seats	Wakefield
Seating material	Cane
Springs	Railway spring
Step treads	Kass-Feralun
Trolley base	U. S.-13-E
Trucks	McGuire-Cummings
Ventilators	Utility
Wheels	Rolled steel—26 in.

Track and Line

Long Beach Railway, Long Beach, L. I., has applied to the Public Service Commission for authority to construct and operate the entire street railway in Long Beach as contemplated in the articles of incorporation of the company. The company has constructed and operated a part of the line and it has now asked the necessary state authority to build and operate from Park Street and Minnesota Avenue to Beach Street to New York Avenue and then to Park Street, making a continuous loop in Long Beach's street railway service.

Power Houses, Shops and Buildings

British Columbia Electric Railway, Vancouver, B. C., will shortly award the contract for the building of the new power house which will house a turbine of 25,000 hp. The entire project will cost in the neighborhood of \$1,500,000.

Trade Notes

Philip L. Thomson, publicity director of the Western Electric Company, has been elected president of the Association of National Advertisers. His election follows successful service as director and since 1921 as vice-president of the association. Mr. Thomson began his business career in 1903 following his graduation from Union College and from Harvard University. For two years Mr. Thomson was employed in the Chicago office of the Western Electric Company. In 1905 he went to Kansas City. Then he became successively manager of the company's headquarters at Pittsburgh and publicity director, in charge of all publicity activities. In this capacity Mr. Thomson has been identified with the development of Western Electric advertis-

ing and publicity in this country, and last spring he spent two months in Europe in connection with the publicity problems of the International Western Electric Company.

Nicholas M. DuChemin has assumed the duties of general superintendent of the West Lynn plant of the General Electric Company following the death of William J. Lloyd. He joined the General Electric apprentice school at the River Works in Lynn and also the engineering school. In addition to this he attended the Suffolk Law School in Boston and took a year's course at the Boston University. During the years 1917 to 1919 he was in the United States navy, enlisting as a seaman and finishing with the commission of lieutenant in charge of construction work for aviation uses. Following his naval service he returned to the Lynn plant of the General Electric Company as a boring mill hand. He soon won promotion and his safety work caused his being put in charge of the Bedeaux point system in the West Lynn plant, the position he occupied when he received his recent appointment as general superintendent.

New Advertising Literature

Combustion Engineering Corporation, New York, N. Y., has published a pamphlet describing the new Frederick stoker. The pamphlet contains a list of a few representative installations of the new Frederick stoker.

Irving Iron Works Company, Long Island City, N. Y., has issued a pamphlet entitled "Safety Under Foot." This pamphlet contains a table of safe loads showing the maximum allowable fiber stress on Irving subways of all types.

Fuller-Lehigh Company, Fullerton, Pa., has issued bulletin No. 900, "Pulverized Coal for Boilers." Fuller-Lehigh Equipment pamphlet and Fuller News, featuring the Fuller-Kinyon conveying system. These three pamphlets, recently released, embody the latest information on pulverized coal as a fuel, both preparation and application.

Carnegie Steel Company, Pittsburgh, Pa., has available to users of steel the ninth edition of the shape book. The new edition is the result of a thorough check and revision of all the sections rolled by the company on its shape, rail, bar and plate mills. While no important changes have been made in the regular sizes of structural and bar mill sizes of beams, channels, angles, tees and zeels, numerous changes have been made in the special sections, such as concrete reinforcement bars, window and casement sections, automobile rim sections and other miscellaneous bar mill sections. Certain rails and splice bar sections which have become obsolete since the issue of the preceding edition have been eliminated in the present issue.

ELECTRIC RAILWAY JOURNAL

A New Year's Announcement

STEEL TWIN TIE TRACK

is renewable

IN the thirteen years since the first installation of Steel Twin Ties was made the outstanding merits of this type of construction have been classified not only by our efforts but by the comments in the technical press of engineers who have installed Twin Tie Track.

That the reasons urged for the use of Twin Ties up to this time have been ample is evidenced by the rapid and consistent adoption of Twin Tie Track. Economical, permanent, adaptable and easy riding track when proved by cost records, years of service, special conditions and by actually riding on it, recommends itself as good construction.

But now, nearly two years after the first test renewal installation was made, it can be positively stated that such track is renewable — that definite details taking into account all engineering requirements have been worked out providing for complete renewal without removing anything but the rail and the paving down

to the base of rail. — Further that the cost of renewal is in the neighborhood of Two Dollars and Fifty Cents a track foot exclusive of new rail, joints, new paving and paving labor.

That such a base is renewable brings forward many interesting if somewhat obvious points. To mention a few — this method of renewal would justify charging the permanent steel tie base to capital account and renewal cost to operating, or — over a period of years it will greatly reduce the car mile charge for maintenance of way. Again, it could be urged that municipalities should carry paving costs where such a permanent base were installed.

In this limited space and as this is merely an announcement, no details are covered here. The complete method is described in a circular now on the press — “How the Second Rail Goes In on a Steel Tie Foundation” which will be mailed to you if your name is on our mailing list, if not please ask for it.

THE INTERNATIONAL STEEL TIE COMPANY

Welcome 1924!

The Electric Railway Industry can look forward with confidence to prosperity during the coming year.

The extended use of efficient cars and equipment; the expansion of freight haulage service; the use of multiple unit trains for mass transportation; the auto bus where suited; and the continued development of public confidence, mean continued prosperity.

The Westinghouse Electric organization stands ready, as in the past, to assist the industry in solving its 1924 problem.

The Volume Index

HAS ALWAYS BEEN a feature of the ELECTRIC RAILWAY JOURNAL. A great deal of care is put on its compilation and a special effort is made by the publishers so that the index will be included in the last number of the volume.

The index of the ELECTRIC RAILWAY JOURNAL has always been much more than an index of titles or even of articles. Where an article treats of a variety of topics, a corresponding number of entries appear in the index, together with supplementary entries under the name of an operating company, if the article relates to or describes the practice of any railway property.

The list of principal key words appearing immediately after the title page was long a unique feature of the ELECTRIC RAILWAY JOURNAL index, though recently some other papers have adopted the same idea. It is designed to aid those who may be uncertain of the exact term under which a certain article is entered. This list of principal key words naturally changes somewhat from year to year with the changes in nomenclature and practice of the industry.

The publisher of the JOURNAL believes the index will be useful to every subscriber, whether he binds his back copies or not. For this reason it does not follow the practice of some papers of requiring subscribers who want a copy of the index to write for one. It binds the index with each copy of the last issue of the volume.

Send for your copy
today.

An occasional publication containing accounts of heating installations of interest to every executive. We will be glad to put you on the mailing list. Write for a copy today.

Electric heat has many uses. A few of these applications are suggested by the small sketches. Electric heat can be used in your business.

Make It Warm for Your Watchman

Your watchman is human, and like others, he cannot work efficiently when cold. Two or three space heaters in the sentry house will keep him warm in the coldest weather, at a surprisingly low cost, and without danger of fire.

The duties of a crane man require that he be ready to promptly respond to exacting responsibility at any time. If his crane cab is chilly, if his fingers are stiff, he will not be able to properly control his crane. Westinghouse space heaters will increase the efficiency of your crane man by keeping him warm.

Order a box of these convenient heaters today, and have your electrician install them in some of those hard-to-heat places around the plant. Then you won't have to worry about the heating problem.

Get in touch with the nearest Westinghouse sales office today. The office representative will gladly give you data on the various sizes.

Welding Steel to Steel with Steel

Welding steel to steel with steel is the easiest method of welding. It will result in a better average of thorough work.

The average welding operator is surer in his work with all steel—the chance of incomplete fusion—of one poorly bonded joint offsetting the value of other good ones—is less.

Welding steel to steel with steel will prove itself out on the job where welding conditions vary—where results must be in the highest average of good joints.

O-B Type AW Arc Weld Bonds are steel terminal bonds. The cable strands are welded into the steel terminals. They offer excellent inducement to 100% bonding, because the terminals are shaped for easy welding—because they provide for on-the-job welding of steel to steel with steel.

The cable strands are welded into the terminals of O-B AW Bonds.

O-B Bonds provide a better circuit because they make good welding easy.

The AW-8 Bond, like the AW-7 shown at top of the page, has steel terminals shaped for easy welding. This ball-of-rail bond can be installed without disturbing paving or any built-up roadway.

Publication 502 has interesting facts on Bonding— *Write for copy*

Grind Every Day Keep Wear Away

The time to do your rail grinding is all the time. There's always some spot that shows corrugations or wear, some joints that need building up, welding and grinding.

Don't wait until you simply have to do it. Look for chances to use your rail welders and grinders. That's the secret of economical track maintenance. Only smooth track satisfies the public, saves the rolling stock, makes speed safe and prolongs the life of the whole track structure. Plenty of grinders and plenty of grinding are true economy.

Have you enough grinders?
Are you doing enough with them?

Ask us for figures from some roads noted for good management.

Equipment for Employees

Uniform Caps
Badges
Punches
Change Carriers

Uniform Buttons
Insignia
Whistles
Signal Lanterns

Change carriers have become more and more a necessity for efficient work, since the advent of the one-man car. Speeds up operation appreciably.

Neatly embroidered, dignified-looking uniform insignia is a self-respect builder for any group of employees. This idea is being adopted by many of the leading steam and electric railways. Furnished in various styles in gold, silver or gilt. Sewed directly to the uniform.

Enameled badges for employees' caps and coats furnished in a wide variety of styles. Well-made and neat, with lettering of utmost legibility.

High-grade punches, with widest choice of die shapes where distinctive characters are desired. The well-known "Utility" type punch and also the "Standard" line.

See Catalog No. 7

for full details and numerous illustrations of employee equipment. Shown in various styles and types which will help you in choosing the right equipment for your requirements.

There Is Keen Competition for the Use of City Streets

THE VARIABLE LOAD BRAKE

The Westinghouse Variable Load Brake has been developed to solve the problem of controlling cars under widely varying load conditions. It is an attachment which may be added to any straight air or semi-automatic equipment whereby the braking force is automatically adjusted to suit the weight on the car, by regulating the brake cylinder pressure as the weight changes.

The adjusting mechanism is thrown into engagement by the opening of the car doors. While the doors are open, passengers are leaving and entering the car, and when the doors are closed again, the condition of loading will be that under which brake operation will take place for the next stop, or a slow-down, as the occasion may demand.

The use of the Brake insures stopping within a uniform distance regardless of whether the car is empty or loaded.

CITY streets have become so crowded that there is constant competition between the various elements of traffic for the right of way—a natural desire on the part of each “to get there first.”

In order to meet this condition and hold their own in the general traffic movement—to maintain satisfactory schedules—street cars must be as mobile as other conveyances which use the streets.

The Variable Load Brake is an effective means of increasing car mobility. By making it practicable to use additional motors for the purpose of higher acceleration, by reducing the average time required for stopping, and by cutting down the running time between stops by allowing longer periods of peak-speed operation, a general speeding-up of service results.

Electric Railway Lubrication

As 1 to 100

With an electric railway using the best lubricants obtainable, the entire cost of the annual oil bill amounts approximately to but one per cent of total maintenance expense.

In a years time, the aggregate amount of money represented by the difference in cost of high grade and lower priced lubricants, is at most, a fraction of this one per cent.

In lubrication history, there has never been an instance where the use of inferior lubricants did not result in increased maintenance expenses. In depreciation alone, the increase will more than offset the initial saving in purchase price.

On electric railway equipment, good lubrication is not a luxury but a necessity—not an extra expense but an economical investment. One that returns large dividends in improved operating efficiency and lower maintenance costs.

Galena Oils and Galena Service constitute a lubrication "buy" that has never failed to register its economic value to the electric railway. Their proven ability to effect savings in "that 99 per cent" of maintenance costs makes Galena lubrication the logical choice for selection.

Peacock Staffless Brakes the choice of Detroit Municipal Railway

Safety first is a mighty important matter in the eyes of those who are responsible for operating the City's transportation system in Detroit. So they specify "Peacock Staffless Brakes" for all new cars. Why? Because, both in theory and in practice, this equipment proves its reliability, its high braking power and its quick, positive action in emergency.

Remember these features:—

- Lightest weight
- Least platform space
- Maximum braking power
- Ample chain winding capacity
- Unfailing reliability
- Least maintenance

The Value of the Statistical Number

The following is an excerpt from the record in a recent court proceeding:

Q. Have you some figures taken from the ELECTRIC RAILWAY JOURNAL?

A. I have.

Q. What is the ELECTRIC RAILWAY JOURNAL?

A. It is a publication generally recognized as an authority on street railway operation.

Q. Have you the figures shown by the ELECTRIC RAILWAY JOURNAL of the cars ordered by city railways within the United States during the eleven years past?

A. I have.

Q. How many cars have been ordered during the past eleven years in the United States?

A. 28,417.

Q. Of that number, how many were open cars?

A. 342.

Q. Have there been any open cars ordered within the United States, according to the articles of the ELECTRIC RAILWAY JOURNAL, since 1916?

A. No.

Q. In 1916 how many cars were ordered?

A. 3,046.

Q. How many of these were open cars?

A. 131 were open cars, or 4.31 per cent.

Q. As you state, no open cars have been ordered since 1916. Is that correct?

A. That is correct.

Q. What was the total number of cars ordered in 1917?

A. 1,998.

Q. In 1918?

A. 1,842.

Q. In 1919?

A. 2,129.

Q. And the following year?

A. 2,889.

Q. And in 1921?

A. 1,059. I might add that these figures cover cars for city service only.

Tie-up with this!

Testimony, like that reprinted at the left, indicates the reliance placed on the Statistical Issue of ELECTRIC RAILWAY JOURNAL.

We repeat—the Annual Statistical Issue is depended upon — used — re-used and kept for reference.

Your advertisement in such a medium will command attention.

the Roman God, after whom January was named, was shown on ancient coins as having two faces—one looking forward, one looking back.

This time of the year is a good time to look back on 1923 and to look forward into 1924.

1923 was a wonderful year for us. More and more Electric Railways came to us for help in conserving Equipment and Power through correct and scientific lubrication.

They have shown their appreciation of Texaco Service (the right oil in the right place in the right amount—and the co-operation of Texaco Engineers) by renewing their contracts.

From where we stand now, 1924 gives every promise of being a mighty fine year for us and a year of satisfaction to numbers of

roads who acknowledge the correctness of the Texaco Policy by the pleasant continuation of their patronage.

We thank them.

For 1924 our Engineering forces have been augmented and our deliveries for service have been expanded to take on all the new business the year will bring us.

We are here for service and shall welcome the opportunity of outlining Texaco Lubricating Service any time you call on us.

We will thank you for the opportunity—and you will thank us for the *results*.

There is a Texaco Lubricant for every purpose—
ROLLING STOCK, POWER PLANT, SUB-STATION—EVERYWHERE

MOTOR AXLES

Full reliance can be placed in a Standard Steel Works Motor Axle. It is made from open hearth hammered steel and in no instance has its manufacture been hurried through in order to reduce production costs.

Any difference you may find in the cost of Standard Steel Works Forgings is a low price to pay for absolute dependability.

*"Not only to make better products but to make them better understood—
not only to sell but to serve, assisting those who buy to choose as well
as use their purchases—this is the privilege, if not the practice
of all modern manufacturers."—Vauclain.*

Use
these practical
books on electricity
for 10 days **FREE!**

YOU will never know how easy it is to master electricity until you see the **LIBRARY OF PRACTICAL ELECTRICITY**, by Terrell Croft.

And you will never know how much a knowledge of electricity means to you in dollars and cents until you gain this knowledge.

The man who knows the most about his work is the man who gets the most in his pay envelope. Croft will teach you as he has taught 40,000 others—teach you by a new, revolutionizing method that saves you time, effort and money. He will teach you electricity as practiced by experts and qualify you for an expert's pay.

The Croft Library

*A combined reference library and home study
Course in practical electricity*

Croft tells you the things you need to know about motors, generators, armatures, commutators, transformers, circuits, currents, switchboards, distribution systems—electrical machinery of every type, its installation, operation and repair—wiring for light and power—how to do it mechanically perfect, in accordance with the National Electrical Code—wiring of finished buildings—underwriters' and municipal requirements—how to do a complete job, from estimating it, to completion—illumination in its every phase—the latest and most improved methods of lighting—lamps and lighting effects, etc.

**Free examination—no money down—
only \$1.50 in ten days and
\$2.00 a month until paid**

Fill in and mail the coupon attached and we will send you the entire set of eight volumes for ten days' Free Examination. We take all the risk—pay all charges. You assume no obligation—you pay nothing unless you decide to keep the books. Then \$1.50 in ten days and the balance at the rate of \$2.00 a month. Send the coupon NOW and see the books for yourself!

Free Examination Coupon

McGraw-Hill Book Co., Inc., 370 Seventh Avenue, New York.

Gentlemen:—Please send me the **Croft Library of Practical Electricity** (shipping charges prepaid) for 10 days' free examination. If satisfactory, I will send \$1.50 in ten days and \$2.00 a month until the special price of \$19.50 has been paid. If not wanted I will write you for return shipping instructions. This Paper is a "Member of the A.B.P."

To you, this is a fact of especial significance, for it means that this publication is part of a concerted movement to raise the level of publishing practice, to assure better service to both subscribers and advertisers.

The "A.B.P." is built upon and revolves around the following set of standards—

STANDARDS of PRACTICE

THE publisher of a business paper should dedicate his best efforts to the cause of Business and Social Service, and to this end should pledge himself—

1. To consider, first, the interests of the subscriber.
2. To subscribe to and work for truth and honesty in all departments.
3. To eliminate, in so far as possible, his personal opinions from his news columns, but to be a leader of thought in his editorial columns, and to make his criticisms constructive.
4. To refuse to publish "puffs," free reading notices or paid "write-ups"; to keep his reading columns independent of advertising considerations, and to measure all news by this standard: "Is it real news?"
5. To decline any advertisement which has a tendency to mislead or which does not conform to business integrity.
6. To solicit subscriptions and advertising solely upon the merits of the publication.
7. To supply advertisers with full information regarding character and extent of circulation statements, subjects to proper and authentic verification.
8. To co-operate with all organizations and individuals engaged in creative advertising work.
9. To avoid unfair competition.
10. To determine what is the highest and largest function of the field which he serves, and then to strive in every legitimate way to promote that function.

Publications which have subscribed to these standards have earned the preferred consideration accorded them.

A Single Segment or a Complete Commutator

is turned out with equal care in our shops. The orders we fill differ only in magnitude; small orders command our utmost care and skill just as do large orders. CAMERON quality applies to every coil or segment that we can make, as well as to every commutator we build. That's why so many electric railway men rely absolutely on our name.

STREET CARS TRUCKS SNOW SWEEPERS

ASTOUNDING Service Records are Being Made!

Traction companies are getting from 50,000 to 100,000 miles from the Thornton Trolley Device. The long life of the bearings, the perfectly balanced wheel and the method of lubrication explain this unparalleled service.

Letters from users ring with praise of the Thornton. Reduce your repair bills and road delays by using this device. Ask for Bulletin.

Ohmer Indicating and Recording Fare Registers

are especially well adapted for use in one-man cars, either for city or interurban service.

The operation is quick and snappy. Each fare is clearly indicated and a correct printed record made of it.

Ohmer Fare Registers offer the only means of placing fare collecting on an absolutely correct business basis.

OHMER FARE REGISTER CO.

Stone and Webster Light-Weight Cars for Texas Properties

American Car Company furnishes Double-end Double- Truck Safety Cars for Beaumont, Fort Worth and Houston Lines

Twenty-seven cars of this type with separate entrance and exit doors to the operator's right on each platform at diagonally opposite corners and having an aisle width of 28 inches, were built recently by the American Car Company for the Stone & Webster Properties in Texas.

While of larger proportions and arranged to handle larger passenger loads, these cars are constructed in accordance with general safety-car practice, insuring light weight and operating economies as well as being of sufficient strength to meet the transportation requirements.

They are mounted on Brill 77-E-1 Low-Level Trucks.

Better Transportation for the Suburbs

In many suburban sections, although traffic may not justify an electric railway system, there is an opportunity in the trackless trolley, which can be installed at a relatively small initial cost. As the community grows, more trolley buses can be operated to keep pace with the increase in traffic until the extension of the track is warranted. In the meantime the trackless trolley system acts as feeder to the main line.

The same G-E equipment which has proved itself on electric railway properties can be adopted as standard equipment for this service. Have you considered the possibilities in the trolley bus?

25-190

The GE-258 Motor and K-63 Controller are successfully driving many of the trolley buses now in service.
